# Mathematics

Assessment Unit C1

*assessing*

Module C1: AS Core Mathematics 1

**[AMC11]**  
**WEDNESDAY 20 MAY, MORNING**

## TIME

1 hour 30 minutes.

## INSTRUCTIONS TO CANDIDATES

Write your Centre Number and Candidate Number on the Answer Booklet provided.

Answer **all eight** questions.

Show clearly the full development of your answers.

Answers should be given to three significant figures unless otherwise stated.

**You are not permitted to use any calculating aid in this paper.**

## INFORMATION FOR CANDIDATES

The total mark for this paper is 75

Figures in brackets printed down the right-hand side of pages indicate the marks awarded to each question or part question.

A copy of the **Mathematical Formulae and Tables booklet** is provided.

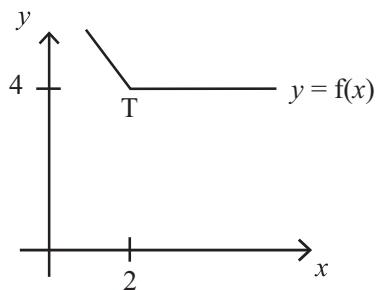

**Answer all eight questions.**

**Show clearly the full development of your answers.**

**Answers should be given to three significant figures unless otherwise stated.**

**You are not permitted to use any calculating aid in this paper.**

- 1 Fig. 1** below shows a sketch of the graph of the function  $y = f(x)$

**Fig. 1**

Point T has coordinates (2, 4).

Sketch, on separate diagrams, the graphs of:

(i)  $y = f(x - 3)$  [2]

(ii)  $y = f(2x)$  [2]

clearly labelling the image of the point T.

(iii) Write down, using function notation, the two possible single transformations of  $y = f(x)$  which each map the point T onto the point (2, 8). [2]

2 The points A and B have coordinates  $(a, -2a)$  and  $(3, 10)$  respectively.

(i) The gradient of the line AB is 2

Show that  $a = -1$

[3]

(ii) Hence find the equation of the line perpendicular to AB passing through the point  $(5, 4)$ .

Leave your answer in the form  $ax + by + c = 0$ , where  $a$ ,  $b$  and  $c$  are integers.

[4]

3 (a) Simplify

$$\left[ (2x - 1)(x + 4) - 2(8x - 7) \right] \div \frac{(2x - 5)}{(x + 2)}$$

[6]

(b) Solve the simultaneous equations

$$\begin{aligned} x + 2y - z &= 9 \\ 3x - 4z &= 13 \\ 4x + y - 2z &= 7 \end{aligned}$$

[6]

4  $f(x)$  is the expression  $2x^3 + 5x^2 + px + q$

$f(x)$  has factors  $(x - 1)$  and  $(x + 3)$ .

(i) Using the Factor Theorem, find the values of  $p$  and  $q$ .

[6]

(ii) Hence find the remainder when  $f(x)$  is divided by  $(2x - 1)$ .

[2]

**5 (a)** Differentiate

$$7x - \frac{\sqrt{x}}{3} + \frac{1}{4x} \quad [3]$$

**(b)** Sketch the curve with equation

$$y = x^3 - x^2$$

clearly indicating all relevant points.

[10]

**6 (a)** Solve

$$5^{4x-3} \times (0.2)^x = \sqrt{5} \quad [6]$$

**(b)** Find the range of values of  $x$  for which

$$x^2 - 5\sqrt{2}x + 12 < 0 \quad [5]$$

- 7 Fig. 2 below shows a candle in the shape of a solid right circular cone.

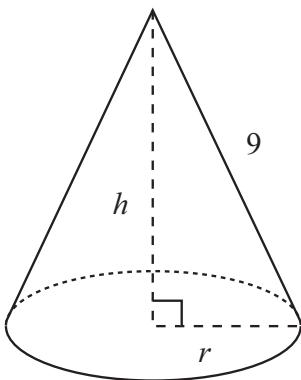

Fig. 2

The candle has base radius  $r$  cm, perpendicular height  $h$  cm and slant height 9 cm.

[Volume of cone =  $\frac{1}{3}\pi r^2 h$ ]

- (i) Show that the volume of the cone can be expressed as

$$V = 27\pi h - \frac{1}{3}\pi h^3 \quad [4]$$

- (ii) Hence find, in its simplest form, the ratio  $h : r$  for which the volume is a maximum. [9]

- 8 Show that the equation

$$kx^2 + (2k + 1)x + (1 - k) = 0$$

has real distinct roots for all non-zero real values of  $k$ .

[5]
