UNIT 4 Transport and Gas Exchange

Timing This unit comprises approximately 20% of the learning material in AS Biology, and about 10% of the learning material in a complete Biology A Level learning programme.

www.papaCambridge.com **Recommended Prior Knowledge** Knowledge of cell structure, as covered in Unit 1, will be helpful here, as will an understanding of diffusion, osmosis and active transport.

Context This Unit considers the way in which cells are provided with their requirements. It builds on what students know of cell structure and movement into and out of cells, and lays the foundations for further work on physiology at A2 level. The work on blood in this Unit leads into the topic of immunity in Unit 5.

Outline The topic of transport is introduced by considering why large organisms need transport systems. Plant transport, including the relation between the structure and function of transport tissues, is then dealt with. Transport in mammals, including structure and function of the heart, blood vessels and blood, are considered, which leads into gas exchange in humans. If preferred, transport and gas exchange in mammals could be covered before transport in plants. There are good opportunities within this Unit for students to reinforce their practical skills relating to Assessment Objectives in Group C (Experimental skills and investigations), particularly in using the microscope to make observations and record them as drawings. Try to ensure that each student works alone and under time pressure on some occasions, as this will help to prepare for the practical examination(s).

Reinforcement and formative assessment < Reinforcement and formative assessment It is recommended that, towards the end of the time allocated to the unit, time be taken to permit reinforcement of the learning that has occurred. Small groups of two or three students could be encouraged to work together for an hour or two of lesson time, plus homework for a week or two. They should prepare a presentation of a topic to their peers. This could be in the form of a poster, a video, a PowerPoint presentation, an OHP illustrated talk...

Formative assessment could take the form of student self-marked minitests, taking just 10 or 15 minutes for students to do and then mark for themselves, perhaps using questions from online question banks such as http://www.learncie.org.uk/ or http://exam.net/public/misc/pub_home.asp – discussing the correct answers as a whole class. At the end of the unit, there should be a much larger formative assessment test, using appropriate past-examination and similar style questions, taking a lesson to do, and a lesson to provide feedback after marking by the teacher.

Learning Outcomes S G(a) explain the need for transport systems in multicellular plants and animals in terms of size and surface area to volume ratio Image: Comparison of the systems in multicellular plants and animals in terms of size and surface area to volume ratio Learning activities Image: Comparison of the systems is to build understanding of: the relationship between surface area and volume; the distance from the outside to the inside; for smaller and larger shapes, and for long-thin, flat and cuboidal / spherical shapes examine a circus of different organisms macroscopically and microscopically for features of their transport, gas and nutrient / waste exchange systems – using whole fresh and preserved specimens, microscope slides, photomicrographs and the CIE Bioscope	Suggested Teaching Activities Use small cubes to build 'organisms'. Students can build cubic organisms with different numbers of blocks, and calculate surface area to volume ratios to discover how this ratio decreases as volume increases. They can also build organisms using the same number of blocks (i.e. the same volume) of different shapes, to illustrate how flattened organisms have larger surface area to volume ratios than 'cubic' ones. Discuss how this relates to the need for transport systems for gases, as well as nutrients and other substances, in animals. Discuss the way in which the branching shape of plants brings a very large surface area into contact with air, so there is no need for a transport system for gases. However, water must be transported from roots to leaves, and nutrients from sources to sinks.	Online Resources CIE Bioscope http://teachers.net/lessons/ posts/2518.html protocol for surface area: volume investigation http://employees.csbsju.ed u/ssaupe/biol116/surf-vol- ratio.htm series of exercises on surface area: volume ratio	Other resourcesGelatine, or better agar, blocks can be coloured using a pH indicator such as cresol red or phenolphthalein. When dropped into hydrochloric acid, the blocks change colour. Blocks can be cut to represent 'cubic' organism and the effect of surface area to volume ratio on diffusion may be measured. There is a protocol in Advanced Biology principles and applications. Study Guide Clegg and MackeanBiofactsheet 7: Comparing transport in plants and animals.Biofactsheet 81: Gas exchange in plantsBiology, Jones, Fosbery , Taylor and Gregory and other textbooks include

G(d)	describe the distribution of xylem and phloem tissue in roots, stems and leaves of dicotyledonous plants Learning activities use dye (e.g. eosin) and whole small plants to investigate water transport system use microscopes, CIE Bioscope and photomicrographs to investigate distribution of xylem and phloem in roots, stems and leaves of dicotyledonous plants such as <i>Ranunculus</i> and <i>Ligustrum</i> investigate and calculate the sizes of structures in xylem and phloem, and magnification of images using microscope slides and CIE Bioscope	Students can stand small plants with intact root systems (wash soil off first) in dye such as eosin for 10-30 minutes, then cut thin sections by hand to investigate the distribution of the dye; this shows the position of xylem vessels in all parts of the plant, and also emphasises their continuous nature. They will probably already have drawn a TS of a leaf in Unit 1, so this can be quickly revised now. Prepared slides of TS root and TS stem provide opportunities for further developing skills of observation and recording, as well as calculating magnification.	http://images.botany.org/ Hundreds of high-quality images, including many leaf, stem and root micrographs. CIE Bioscope Lots of University Department and microscope manufacturer websites have wide collections of photomicrographs that students will find interesting e.g. http://micro.magnet.fsu.ed u/index.html	Both Practical Advance. Biology, King et al, and Comprehensive Practical Biology, Siddiqui, have guidance for observing and recording the distribution of these tissues. The CD-ROM: Images of Biology for Advanced Level published by Stanley Thornes has suitable images that are useful here Biofactsheet 19: Plant tissues Biology, Jones, Fosbery , Taylor and Gregory and other textbooks include	oridge.com

G(g) (h)	 explain the movement of water between plant cells and between them and their environment, in terms of water potential; describe the pathways and explain the mechanisms by which water is transported from soil to xylem and from roots to leaves Learning activities review water potential with oral question and answer / whole class discussion and revision questions work out which way water will flow to and from cells / environments with given water potentials (no calculations of water potential are expected) build understanding of mechanisms and pathways of movement of water through plants with oral question and answer / whole class discussion and written questions give brief written explanation why water flows as a result of water potential, and the flow of water from soil, through plant, to air as a result of water potential (including the role of cohesion- tension), and other potential and a^a 	Use questioning to revise earlier work on osmosis, and lead in to the way in which root hairs provide a large surface area for water uptake. Root hairs can be seen clearly on newly-germinated seedlings, such as mung beans, if these are grown on damp filter paper or cotton wool. Provide an overview of the movement of water down a water potential gradient from soil to air, before looking at each part of this pathway in more detail. The work on cohesion-tension needs to be linked to the next section (G(b)(c)) on transpiration. Transpiration reduces the water potential at the top of the plant, producing the 'tension'.	http://www.microscopy- uk.org.uk/mag/artmar00/w atermvt.html A clear description of water movement through a plant, including high- quality micrographs. http://web.ukonline.co.uk/ webwise/spinneret/plants/p ltrsu.htm interactive questions and answers (hold mouse over answer to reveal) http://www.mhhe.com/bio sci/pae/botany/histology/ht ml/memtrans.htm nice description of symplast and apoplast http://users.rcn.com/jkimb all.ma.ultranet/BiologyPag es/X/Xylem.html detailed information on transport across roots and up xylem	BIOFACTSHEET 82: TRANSPORT IN FLOWERING PLANTS Biofactsheet 108: Water movement across the root. G(o) (p)	 describe the role of haemoglobin in carrying oxygen and carbon dioxide; describe and explain the significance of the dissociation curves of adult oxyhaemoglobin at different carbon dioxide levels (the Bohr effect) Learning activities step by step introduction through whole class discussion / verbal question and answer / animations and simulations / answering written questions / making annotations to diagrams: to introduce partial pressure as a measure of amount of oxygen to introduce the oxygen dissociation curve as results from experimental measurements to explain the loading and unloading of oxygen in lung and in resting tissue to explain the release of more 'stored' oxygen in working tissue to explain the roles of haemoglobin in carriage of 	Use question and answer to help students to remember what they have already learnt about haemoglobin structure, then move on to discuss with them how a haemoglobin molecule carries oxygen. Emphasise the importance of releasing oxygen, as well as binding with it. Introduce the oxygen dissociation curve steadily and carefully - students often find this difficult to understand. Give them questions to answer which involve interpretation of the curve, to help them to consolidate their understanding and to develop their skills of data handling. The Bohr shift makes sense if you explain it in relation to carbon dioxide carriage by haemoglobin. Its significance should be discussed in relation to the greater need of tissues for oxygen when respiring actively.	http://www.manbit.com/hb diss.htm An interactive haemoglobin dissociation curve; students can alter parameters such as carbon dioxide concentration and see how this affects the curve. http://www.biology4all.co m/resources_library/details .asp?ResourceID=8 A downloadable PowerPoint presentation.	Biology, Jones, Fosbery, Taylor and Gregory. explains the oxygen dissociation curve and has structured questions (with answers) about it. Biofactsheet 9: Oxygen dissociation curves.
