MARK SCHEME for the June 2005 question paper

9701 CHEMISTRY

9701/04 **Paper 4 (Structured Questions A2 Core), maximum raw mark 60**

This mark scheme is published as an aid to teachers and students, to indicate the requirements of the examination. It shows the basis on which Examiners were initially instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began. Any substantial changes to the mark scheme that arose from these discussions will be recorded in the published *Report on the Examination*.

All Examiners are instructed that alternative correct answers and unexpected approaches in candidates' scripts must be given marks that fairly reflect the relevant knowledge and skills demonstrated.

Mark schemes must be read in conjunction with the question papers and the *Report on the Examination*.

- CIE will not enter into discussion or correspondence in connection with these mark schemes.

CIE is publishing the mark schemes for the June 2005 question papers for most IGCSE and GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

Grade thresholds for Syllabus 9701 (Chemistry) in the June 2005 examination.

	maximum mark available	minimum mark required for grade:		
		A	B	E
Component 4	60	45	40	22

The thresholds (minimum marks) for Grades C and D are normally set by dividing the mark range between the B and the E thresholds into three. For example, if the difference between the B and the E threshold is 24 marks, the C threshold is set 8 marks below the B threshold and the D threshold is set another 8 marks down. If dividing the interval by three results in a fraction of a mark, then the threshold is normally rounded down.

It has a high activation energy/E_a **[1]**

(ii) $MgCO_3$ will decompose at a **lower** temperature/needs less energy **[1]**

Mg^{2+} is a smaller (ion) than Ca^{2+} **or** Mg^{2+} has high charge density **[1]**

So polarises/distorts the anion CO_3^{2-} ion more easily

Part (a): [5]

(b) $\Delta H = 82 - 178 = \mathbf{-96}$ (kJ mol^{-1}) **[1]**

due to the electron-withdrawing (inductive) effect of Cl... **[1]**
either...stabilising the anion, **or** spreading (-) charge more,
or...weakening the O-H bond in the acid, **or**...increasing ionisation,

or: add MnO_4^-/H^+/warm **A** changes from purple to colourless
or: add $PCl_5/POCl_3/PCl_3/SOCl_2$ **A** gives fumes
or: add CH_3CO_2H + conc. H_2SO_4 **A** gives fruity smell
