INIVED SITV ACAMEDIDCE

FB 1 is 0.200 mol dm⁻³ propanoic acid, $C_2H_5CO_2H$. **FB 2** is 0.100 mol dm⁻³ sodium hydroxide, NaOH. 1 S is an organic liquid which is immiscible (forms two separate layers) with water.

www.papacambridge.com On shaking FB 1 with the solvent S, propanoic acid is transferred from the aqueous layer to the organic layer until equilibrium is reached. You are to investigate this equilibrium in the following experiments.

(a) Preparation of the equilibrium mixtures

Experiment A

Use a measuring cylinder to place 50 cm³ of **FB 1** into the stoppered conical flask labelled A.

Use the measuring cylinder to add 20 cm^3 of **S** to the flask and replace the stopper.

Experiment B

Use the measuring cylinder to place 50 cm³ of **FB 1** into the stoppered conical flask labelled B.

Use the measuring cylinder to add 40 cm^3 of **S** into the flask and replace the stopper.

Shake the flasks vigorously for 3 minutes, then leave to stand.

START YOUR ANSWER TO QUESTION 2, but shake the flasks vigorously for 1 minute after each 5 minutes, returning to Question 1 after a minimum of 15 minutes or when you have completed Question 2. You are attempting to establish an equilibrium mixture of propanoic acid dissolved in water and in solvent S in each flask.

One of the two following equilibrium mixtures is established.

I $C_2H_5CO_2H$ (aqueous layer) $\implies C_2H_5CO_2H$ (organic layer)

For this equilibrium, $K_c = \frac{[C_2H_5CO_2H(\text{organic layer})]}{[C_2H_5CO_2H(\text{aqueous layer})]}$

II $C_2H_5CO_2H(aqueous layer) \implies \frac{1}{2}(C_2H_5CO_2H)_2$ (organic layer)

For this equilibrium, $K_{c} = \frac{\sqrt{[C_{2}H_{5}CO_{2}H(\text{organic layer})]}}{[C_{2}H_{5}CO_{2}H(\text{aqueous layer})]}$

You are to determine which of the two K_c expressions is supported by the results of your experiment.

2

(b) Titration of Flask A

www.papaCambridge.com Allow the layers to separate after the final shake. Fill the burette with FB Tilt the flask and carefully pipette 10 cm³ of the lower (aqueous) layer into a titration flask. Place your finger over the top of the pipette, or fit pipette filter if available, before lowering into the solution. This will minimise the amount of the top layer that enters the pipette. Withdraw 10 cm³ of the lower layer.

Add two drops of phenolphthalein indicator and titrate with **FB 2** until a faint permanent pink colour is obtained.

Repeat the titration two more times and record the results of each titration in Table 1.1 below.

Table 1.1 Titration of Flask A

Summary

10 cm³ of the aqueous layer in Flask **A** react with cm³ of **FB 2**.

Show which results you used to obtain this volume of FB 2 by placing a tick () under the readings in Table 1.1.

(c) Titration of Flask B

Titrate three 10 cm³ portions of the **lower** (aqueous) layer in the same way as for Flask A.

Record the results of each titration in Table 1.2 below.

Table 1.2 Titration of Flask B

final burette reading / cm ³		
initial burette reading / cm ³		
volume of FB 2 used / cm ³		
		[1] -

Summary

10 cm³ of the aqueous layer in Flask **B** react with cm³ of **FB 2**.

Show which results you used to obtain this volume of **FB 2** by placing a tick () under the readings in Table 1.2.

You are advised to show full working in all parts of the calculations.

- www.papacambridge.com (d) Calculate how many moles of propanoic acid were contained in 50 cm³ of FB 1.
- (e) For each flask, calculate how many moles of propanoic acid remain in 50 cm³ of the aqueous layer after shaking with solvent S.

For each flask, calculate the concentration layer S .	5 , in mol dm ^{-3} , of propanoic acid in th	For Examiner's Use
Flask A	Flask B	- Sge.com
		[2]

(i) Use your results to (g) and (h) to investigate which of the K_c expressions, I or II on page 2, is correct.

	Equation is correct.
	[2]
(j)	Suggest two reasons why the calculated values for K_c may still vary even when the correct equilibrium expression is used.
	Reason 1
	Reason 2
	[2]
(k)	The concentration of propanoic acid in the organic layer can be determined by direct titration. 10 cm^3 of the organic layer is pipetted into a titration flask. 15 cm^3 of distilled water is added and the mixture is titrated with FB 2 , shaking between each addition of FB 2 . Suggest why the 15 cm^3 of distilled water is added to the titration flask.

	[Total: 20]

2 ASSESSMENT OF PLANNING SKILLS

You are provided with solutions FB 3, FB 4 and FB 5.

The solutions are:

 1.0 mol dm^{-3} sodium hydroxide 1.0 mol dm^{-3} sulphuric acid 0.5 mol dm^{-3} sulphuric acid

You are to plan experiments that will enable you to identify the solution that matches each of **FB 3**, **FB 4** and **FB 5**.

6

You have available the following apparatus:

-10 °C to 110 °C thermometer,

100 cm³ beaker,

the measuring cylinder from question 1.

The measuring cylinder should be rinsed thoroughly before each use.

(a) You are to identify, by the **minimum number** of practical steps, which of the solutions contains sodium hydroxide.

Your experiment(s) must use only the solutions and apparatus above.

Outline your method – with an explanation of the expected results.

Carry out your plan.
