Assessment at a glance	3
Paper 2 – Structured questions	4

Introduction

www.PapaCambridge.com The main aim of this booklet is to exemplify standards for those teaching Cambridge IGCSE Economics (0437) and to show how different levels of candidates' performance relate to the subject's curriculum and assessment objectives.

In this booklet a range of candidate responses has been chosen from Paper 2 to exemplify grades A, C and E. Each response is accompanied by a brief commentary explaining the strengths and weaknesses of the answers.

For ease of reference the following format has been adopted:

Each question is followed by an extract of the mark scheme used by examiners. This, in turn, is followed by examples of marked candidate responses, each with an examiner comment on performance. Comments are given to indicate where and why marks were awarded, and how additional marks could have been obtained. In this way, it is possible to understand what candidates have done to gain their marks and what they still have to do to improve their grades.

This booklet does not cover Paper 1 candidate responses as it is a multiple-choice question paper. The mark scheme provides sufficient detail and the candidate answers do not require examiner commentary to expand on why the marks were given.

Past papers, examiner reports and other teacher support materials are available on Teacher Support at http://teachers.cie.org.uk

Assessment at a glance

The assessment has two components, Paper 1: Multiple choice and Paper 2: Structured questions. Candidates must take both papers. Candidates receive grades from A* to G.

Component 1: Paper 1: Multiple choice

Candidates answer thirty multiple-choice questions.

Weighted at 30% of total available marks.

Component 2: Paper 2: Structured questions

Candidates answer one mandatory question, which requires them to interpret and analyze previously unseen data relevant to a real economic situation, and three optional questions from a choice of six. Weighted at 70% of total available marks.

www.PapaCambridge.com

Paper 2 - Structured questions

Question 1

1 The challenges facing Angola

Angola is one of the fastest growing economies in the world and also one of the most specialised. It had an average annual growth rate of 11% between 2002 and 2012. In 2010, the country's capital city, Luanda, was the most expensive capital city in the world. The average fare charged by the only taxi (cab) firm in the city was high at US\$50, and a standard house cost more than US\$1m to buy.

Oil production plays a key role in the economy. The country produces 1.9m barrels of oil a day and this is expected to double by 2020. There is the possibility that Angola could overtake Nigeria to become Africa's largest oil producer. The oil industry accounts for most of the country's output, provides 97% of its export revenue and 75% of government tax revenue.

Economists have expressed concern that the country is too dependent on oil. Sonangol, the stateowned oil enterprise, is seeking to diversify. It is already involved in banking and it also owns an airline and a football team. The government is trying to develop other industries. One of these is the diamond industry. World demand for diamonds increased in 2012.

The Angolan Government faces a number of challenges in promoting other industries. One of these is a lack of capital equipment in its manufacturing industries, and another is that much of its agriculture is in the form of subsistence farming.

The economy faces other problems and three of these are connected. They are a widening gap between the rich and the poor, a lack of education, and a rapidly growing population. Some people in the country are very rich but 35% of the population live in poverty. Half of the population have no access to health care, the infant mortality rate is one of the highest in the world, and life expectancy is one of the lowest. Most of the population only experience five years of education and a third of adults are illiterate. Between 2005 and 2010, the country had the eighteenth fastest growing population which might have influenced its level of average income – see Table 1.

Table 1: Population growth, Gross Domestic Product (GDP) and GDP per head in selected African countries in 2011

Country	Population growth (annual % change)	GDP (US\$bn)	GDP per head (US\$)
Angola	2.92	120	6000
Kenya	2.58	72	1800
Nigeria	2.50	420	2600
South Africa	0.96	562	11 100
Uganda	3.24	47	1300

www.papaCambridge.com In 2012, Angola was experiencing an overall unemployment rate of 26% and an unel rate of 50% among the young. The Angolan Government was considering cutting taxes to unemployment.

(a) Why is the Angolan economy considered to be 'specialised'?

- (b) Using information from the extract, explain why taxi (cab) fares were high in Luanda in 2010.
- (c) Using information from the extract, draw a demand and supply diagram to show what is likely to have happened to the price of diamonds in 2012.
- (d) Explain why countries with a high population growth rate may have a lower average income than countries with a lower population growth rate.
- (e) Analyse whether the information in Table 1 supports the view that countries with a high population growth rate have a lower average income than countries with a lower population growth rate. [4]
- (f) Discuss whether an increase in a country's GDP will reduce poverty in that country. [5]
- (g) Using information from the extract, explain two reasons why labour productivity is low in Angola. [4]
- (h) Discuss whether a cut in taxes will reduce unemployment. [6]

Mark scheme

(a) Why is the Angolan economy considered to be 'specialised'?

1 mark each for any of the following two:

- www.PapaCambridge.com most of its output is oil/plays a key role in the economy/country too dependent oil/dependent on oil/most of its resources are devoted to oil
- oil production accounts for 97% of its export revenue
- provides 75% of government tax revenue
- government trying to develop other industries/diversify

Note: no marks for produces 1.9m barrels a day/large quantity of oil/specialises in oil.

(b) Using information from the extract, explain why taxi (cab) fares were high in Luanda in 2010. [2]

1 mark for recognising there is only one firm/a monopoly.

1 mark for mentioning that the lack of competition enables firms to drive up price/firm is a price maker/price can be driven up because demand is inelastic.

(c) Using information from the extract, draw a demand and supply diagram to show what is likely to have happened to the price of diamonds in 2012. [4]

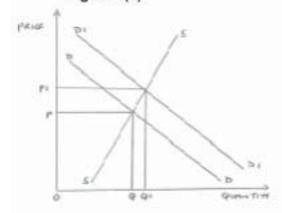

1 mark for axes correctly labelled – price and quantity or P and Q.

1 mark for demand and supply curves correctly labelled.

1 mark for demand curve shown shifted to the right.

1 mark for correct equilibriums identified either by lines drawn to both axes or equilibrium points clearly identified e.g. E and E1.

(d) Explain why countries with a high population growth rate may have a lower average income than countries with a lower population growth rate. [3]

- May result in more dependants [1] due to rise in birth rate or fall in death rate [1].
- May mean fewer workers [1] if there is a high birth rate, there may be fewer parents in the labour force [1].
- A higher labour force may increase competition for jobs [1] may push down wages [1].
- There may not be enough vacancies [1] for increasing number of potential workers [1].
- Resources may be devoted to providing for the extra population [1] rather than expanding productive capacity [1].

- Population may grow more rapidly than GDP/average income is population [1].
- Population growth may be caused by low income [1].

www.PapaCambridge.com Note: these points may be inter-linked. 3 marks may be awarded for one reason that is developed.

- (e) Analyse whether the information in Table 1 supports the view that countries with a high population growth rate have a lower average income than countries with a lower population growth rate.
 - Generally the information supports the view/ supports the view. [1]
 - Uganda has the highest population growth rate and the lowest real GDP per head/Kenya's population growth rate is higher than Nigeria's and its income per head is
 - South Africa has the lowest population growth rate and the highest real GDP per head.
 - [1] Angola is an exception - second in both rankings. [1]
- (f) Discuss whether an increase in a country's GDP will reduce poverty in that country. [5]

Up to 3 marks for why it might:

Up to 3 marks for: may generate more tax revenue [1] which can be used on spending on benefits [1] or on measures to reduce poverty in the long run e.g. education and health care [1].

Up to 3 marks for: high GDP may increase average incomes/living standards [1] higher incomes may enable people to spend more on basic necessities [1] such spending will reduce absolute poverty [1].

Up to 3 marks for: higher output will create jobs [1] this will reduce unemployment [1] with more in work absolute poverty will fall [1].

Up to 3 marks for why it might not:

Up to 3 marks for: income may be unevenly distributed [1] and so not every one may benefit from higher incomes [1] and so relative poverty may rise [1] even if absolute poverty falls [1].

Up to 2 marks for: real GDP may not have increased [1] need to adjust for inflation [1].

Up to 2 marks for: (real) GDP per head may not have increased [1] if population has risen by more than GDP [1].

Maximum of 3 marks for a list-like response.

(g) Using information from the extract, explain two reasons why labour productivity is low in Angola. [4]

1 mark each for two reasons identified:

- lack of capital equipment
- subsistence farming
- lack of education/high degree of illiteracy
- poor health care.

1 mark each for two reasons explained:

- workers will not be able to produce much if they are working with low amount
- subsistence farming tends to use poor quality resources
- www.PapaCambridge.com poor education will mean workers are unable to work with advanced technology less inventive/will lack skills
- poor health care may result in workers being off sick/being tired.

(h) Discuss whether a cut in taxes will reduce unemployment.

[6]

Up to 4 marks why it might:

Up to 3 marks for: a cut in income tax will increase disposable income [1] this may increase the incentive to work [1] a greater incentive may reduce voluntary/frictional unemployment

Up to 3 marks for: a cut in corporation tax will increase the profit firms can keep [1] this may encourage firms to expand [1] and so take on more workers [1].

Up to 3 marks for: a reduction in income tax and indirect taxes will increase purchasing power [1] this may increase demand [1] and so cyclical unemployment may fall [1].

Up to 4 marks for why it might not:

Up to 3 marks for: firms may not spend extra profits on expansion [1] if they lack confidence that they will sell the extra output [1].

Up to 3 marks for: consumers may not spend extra income [1] if they lack confidence [1] instead they may save the extra income [1].

Up to 3 marks for: tariffs may be cut [1] which may increase imports [1] and raise unemployment, at least, in the short run [1].

Up to 3 marks for: government spending may fall [1] due to less revenue [1] and as a result cyclical unemployment may stay unchanged/increase [1].

Up to 3 marks for: higher demand may cause inflation [1] may result in workers pressing for wage rises [1] firms may make workers redundant to cut costs [1].

Up to 3 marks for: a cut in taxes on firms may encourage firms to use more capital-intensive methods (1) resulting in lower demand for labour (1) causing technological unemployment (1)

Up to 2 marks for: frictional and structural unemployment may not fall [1] if unemployed workers are still occupationally and/or geographically immobile [1].

Maximum of 3 marks for a list-like response.

Example candidate response – grade A

L	a	The Angolan economy is considered to be specialised becan
		The Angolan economy is considered to be specialised because the of the country's output depends on one good only
200		which is oil.
4	Ь	Taxi faces in Luanda were high in 2010 because there
	reice sur	is only one taxifim in the city therefore there is
		a monopoly which makes it possible for the firm to
		charge high prices because there are no other options.
1	c	P NORLD DEMAND S
		P2 D +0 D'
		P 1 therefore
11170		1 10
		Denard increased therefore & from Q, to Q2
		therefore prices also increased from P. to Pz.
1	d	Countries with a high population growth rate may have a
A.A.I.I. C.		lower average income than countries with a lower
		population growth rate because the total sun of
		incomes will have to be divided by a larger
		population to calculate the average income , the
		Also, population growth happens when birth rate increases
		and death rate decreases, increasing the dependency
		ratio, as less people will be working therefore
		average incomes will be lower charge
1	e	Vgarda, which has the highest percentage of population
		growth amongst the elisted countries has the
		lonest average income and South Africa, which
		In a stle lowest percentage than change of population
		growth has the highest average income so they
		support the view that countries with a high popular
		growth rate have a lower of average income than
		countries with a loner population growth caster, but
		Angola's population growth langual y change 1 is higher

		than Kenya and Nigeria's total it's average and it's average and income is still higher than theirs.
		income is still higher than theirs.
1	7	The gross donestic product is to measure for the
10.000		total output in a given are for a given time.
		If aDP increases it wears there is a high output,
		which users high demand for the goods in the
		country. This demand wears more profit for
		firms so they might increase they their workforce
		and decrease unemployment and poverty High
		dema aggregiate demand in a country also
		measure higher tax revenues for governments
		which can be used to troduce more public goods
		and services, such as health care and education
		18' that will decrease poverty and living sten.
		Standards. However, an increase in CDP may not
		reduce poverty if only few people benefit, widening
		the gap between rich and poor even more.
		Also, if aDP increases without an increase in
		living standards (e.g. health care) and education
		the poor will stay poor, and rich with as button.
		because of lack of productivity, caused by
		poor health, and lack of skills and qualifications
		reressary to find a job and earn income.
1	9.	The population in Angola lacks education,
		recessary for people to learn more skills and
		qualifications to improve efficiency and
		thus productivity. They also lack healthcare,
300		which means people will be a ill more often
		and for longer periods of time, decreasing
		productivity.
1	_ h_	A get in taxes means firms will earn more profit
		because they will have a smaller tax on profits
	1000	made and they might use that profit to

	employ more a worrest, reducing unemployment. The lower taxes on incomes means people will have
	lower taxes on incomes means people will have
	more to spend on goods and solvices, increasing
+	High demands means more profit for firms
	which will have need even an even
	larger workforce idecreasing unemployment.
	A cut in taxes may have a multiplier
	effect. However, films may not increase labour
	and use the extra profit to invest in different
	sectors such as new machinery. Demand may
	still remain low even it prices are lower
	because people still earnot afford them or because
	trey want to save for future spendings and
	therefore firms may not earn more profit and
115165-0-	might not hire more workers.

Examiner comment – grade A

- (a) The answer might have provided more evidence but it does note that most of Angola's output is oil. (1/2)
- **(b)** A brief but pertinent answer which recognises the significance of there being only one taxi firm in Luanda. (2/2)
- (c) An accurate and well-labelled diagram is produced here. As the question asks candidates to 'draw a demand and supply diagram to **show** what is likely to have happened to the price of diamonds in 2012' it was not necessary to provide written comments. (4/4)
- (d) A perceptive answer which recognises how average income is calculated and explains the impact that a high population growth rate may have on the dependency ratio. (3/3)
- **(e)** There is a good approach here to the question. The candidate's answer provides an accurate interpretation of the table to draw the conclusion that most of the evidence does support the view. It backs this up with relevant data and mentions an exception. (4/4)
- (f) This is again a strong answer. There are clear analytical links established between higher GDP, total demand, unemployment, tax revenue and poverty. The discussion then goes on to consider why an increase in GDP may not reduce poverty. This recognises that not everyone may benefit and that the poor may not be able to gain employment. (5/5)
- **(g)** Two relevant reasons are identified. The explanation is stronger on the lack of education but is just sufficient on health care. (4/4)

e possible et It starts examinery than workers.

That products the

(h) This is good on why a cut in taxes may reduce unemployment, recognising the possible enthe ability and incentive for firms to take on more workers to increase output. It starts examinal ternative possibility well by mentioning that firms may employ more machinery than workers. comes close to making a relevant point about how people may not spend more but this could have been clearer. For example, it might have been linked to cuts in income tax rates or to what products to cuts in indirect taxes are affecting. (5/6)

Total mark awarded = 28 out of 30

Example candidate response – grade C

1_	a	didate response - grade C The Gromony is Considered to be Specialized Since according to them they can to doubte the autput
1		according to them they can to doubte the autput of ail from 1.9 months barrels, which means that they will be using their resources more efficiently as the lection is brigging to be more productive and only because of specialization autput can be increased
		because of Specialization autjust can be increased
	ь)	Since the Laranda is said to be said to be the most expensive capital in the would so along with other expenses such as housing & cost of querating a tani also has to be high Since it the aperating charges are high the fores are also going to be higher
	price	Since the demand had increased The Supply has also increased along with the price of the diamone quantity demanded
	_ d)	Countries which have started having lower population growth rate have their population more ealquested and establish which helps them get john with better pays and which increases the assessed eincome since the population has not been increased and the encreased eincome of government is also divided between four people which also helps them to increase ourage income rate.

	are less motivated and autput is also tow,
h	reduction in taxes law increase aggregate domand
	parause of which people will want to spend more Since they have nore and they have to pay less indirect taxues, when the elemand
	increases the Supply also has to increased and to do that more labour or employeer are required the mages of abilled labour also increase because
	of which they can now spand more:

Examiner comment – grade C

- (a) The answer appears to be uncertain of the meaning and significance of specialisation. There is a confusing statement at the end that 'only because of specialisation output can be increased'. This apparent lack of understanding of the term resulted in the candidate not being able to address the question directly. (0/2)
- **(b)** The answer does not pick up on the reference to a specific year and so does not concentrate on the particular reason why taxi fares were high in that year. Closer attention to the wording of the question was required. **(0/2)**
- (c) The diagram shows the demand curve shifting to the right. The axes and the demand and supply curves are accurately labelled. By shifting the supply curve to the left it does, however, not get the new equilibrium correct. (3/4)
- (d) There is some awareness here of the nature of average income. Points, such as the level of education people will have, are asserted rather than explained. (1/3)
- (e) The answer concludes that the data supports the view but does not provide any evidence to back up this finding. Indeed, most of the answer is not making use of the information in Table 1. (1/4)
- (f) This answer contains some good economics and analytical links provided between an increase in a country's GDP and a fall in poverty via a rise in employment. It is, however, a one-sided answer. There is no attempt to examine why poverty may fall and so a discussion is not established. (3/5)
- **(g)** A good answer. The impact of a lack of education on skills and efficiency is brought out and the effect of a lack of capital equipment on workers' ability to increase output is explained. (4/4)
- **(h)** The reference to 'since they save more' might be clearer. The implication is that people will have more money to spend. The answer is, nevertheless, reasonable on why a cut in taxes may reduce unemployment. Again, however, the candidate does not pay careful attention to the command word at the start of the question and, as a result, a one-sided answer is provided. (3/6)

		decrease of taxes
		Western CT (ME)

www.PapaCambridge.com

Examiner comment – grade E

- (a) The candidate is lifting information from the extract but it is neither interpreted nor related to the question. (0/2)
- **(b)** Some of this answer would have been more relevant to question 1(a). Again, the answer does not directly answer the question. (0/2)
- (c) The axes and the demand and supply curves are labelled accurately. Unfortunately, the supply curve rather than the demand curve is shifted to the right. (2/4)
- (d) There is some awareness shown of the causes of a high population growth rate but there could have been more direct links established between a change in population and a change in average income. (1/3)
- (e) The candidate, unfortunately, does not answer the specific question set. There is no reference to the information in Table 1. (0/4)
- (f) This is a relevant answer but it is one-sided. The candidate recognises that living standards may rise due to higher income and that unemployment may fall. These points might have been developed further and the reasons why a higher GDP may not reduce poverty is not covered. (2/5)
- **(g)** This is a good answer. Two relevant reasons are identified and the reason why a lack of education leads to low productivity is explained. (3/4)
- **(h)** The answer starts quite well by recognising that lower taxes may reduce prices. The link to lower unemployment is not established and the answer does not cover any other points. (1/6)

Total mark awarded = 9 out of 30

Question 2

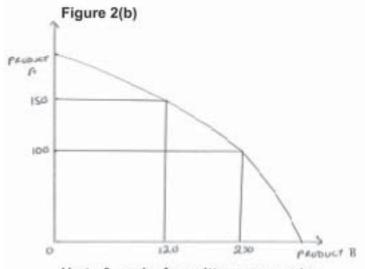

- A number of economies are devoting more of their resources to the provision of health to the economic problem, this involves them having to make difficult choices.
 - (a) What is meant by the 'economic problem'?
- www.PapaCambridge.com (b) Using a production possibility curve diagram, explain why choices have to be made as to how to allocate resources.
 - (c) Explain how resources are allocated differently in market and mixed economic systems. [4]
 - (d) Discuss whether an economy would benefit from an increase in the provision of health care. [8]

Mark scheme

- (a) What is meant by the 'economic problem'? [2] 2 marks for wants exceeding resources or wants are unlimited/infinite whilst resources are limited/finite or 1 mark for limited resources or scarcity.
 - (b) Using a production possibility curve diagram, explain why choices have to be made as to how to allocate resources.

Up to 3 marks for the diagram:

- 1 mark for axes correctly labelled in terms of two different products or types of products.
- 1 mark for curve or downward sloping line drawn to the axes.
- 1 mark for showing a trade off.

Up to 3 marks for written comments:

- definition of opportunity cost (1)
- recognition choice arises because of scarcity (1)
- example based on the diagram; if an economy produces e.g. 200 units of B it cannot produce 150 units of Product A (1)
- recognising that if an economy chooses to allocate more resources to making one product, it has to allocate fewer resources to another product/chooses to make more of one product it has to produce less of another product (2).

(c) Explain how resources are allocated differently in market and mix systems.

Up to 3 marks on market economy:

1 mark for recognising that in a market economy the price system allocates resources.

www.PapaCambridge.com 1 mark for referring to the rate of demand and supply in a market economy/consume sovereignty.

1 mark for role of the profit motive in a market economy.

1 mark for resources are allocated by the private sector/there is no government intervention.

Up to 3 marks on mixed economy:

1 mark for recognising the price system determines the allocation of some resources in a mixed economy.

1 mark for recognising that the government decides on the allocation of some resources in a mixed economy e.g. governments produce public goods, governments produce or subsidise merit goods and tax demerit goods.

1 mark for recognising there is both a private and public sector.

(d) Discuss whether an economy would benefit from an increase in the provision of health care. [8]

Up to 6 marks for why it might:

Up to 3 marks for: likely to improve the health of workers [1] this should raise labour productivity [1] and so increase output/GDP [1].

Up to 3 marks for: possible reduction in birth rate [1] this may increase the labour force [1] and reduce dependency ratio [1].

Up to 2 marks for: likely to increase the quality of life/standard of living [1] which should increase life expectancy [1]

Up to 2 marks for: more people are likely to be employed in health care [1] this may reduce unemployment [1].

Up to 2 marks for: may make an economy a more attractive destination for FDI [1] which may provide a number of benefits e.g. advances in technology, higher employment [1].

Up to 6 marks for why it might not:

Up to 3 marks for: if resources are fully employed [1] it will involve an opportunity cost [1] e.g. fewer resources may be devoted to education [1].

Up to 3 marks for: may reduce the death rate [1] this may increase dependency ratio [1] and increase the cost of pensions [1].

Up to 3 marks for: more health care may be provided but the quality may not rise [1] population may increase by more than the extra provision [1] inefficiency may rise [1].

Maximum of 4 marks for a list-like response.

Example candidate response – grade A

2.	α.	didate response - grade A The economic public is that there is a scancity in resources and as unlimited Jemands i.e.
_		resurrces me finite where neutra are infinite.
	b.	Production possibility The production possibility curve of Goods A,B curve shows us that
		there is an opportunite
	-	in an economy, thrus is
		the next best affermati
-		forsone when choosing
		As As Good A
		shows the maximum amount of resonces available
		to a firm or an individual when allocatry resources.
		They can use the amount of resources under or on
		The cruse but can not above as resonces are limite.
		The curve shoust hat if more resources are used in product
		good B lat Bz) then leas resources creallocated to good
		A (Az). The apportunity cost here is the number of good A
		that wild have been produced. Vice versa, it move of good A's
		are produced (A,) less of good B is produced (B3)
	-	In a market system, resources are allocated

	shown in the suph below with demand and supply
	shown in the graph below with demend and supply
P	1 .5 where prices are determed.
	In other navds, resources are
	only allocated to producing
	products that consumers
v	rent. However, in a mixe
	economic system, there is
	a certain level of government
	I mterrentian. This is when
	and the government has a level
	of control over the resources. As a result, allocation
	is not based punely on price mechanism but also on
	whit the government decides to provide that may not be
	and lable in a number 4 ystem eg. public goods and mente
	goods. Negatre externationes are also tener to a cruent.
d-	An increase in the governments provision of health ene
	can be both beneficial and disadvantageous to an
	economy.
	In terms of benefits, firstly, an increase in
	provision of health care would significantly improve
	health aspects of the standard of living. This includes
	lower infant nor toling rate, longer like expectancy,
	lower death rate and less number of people getting
	sich.
	This lends to the second benefit. If there are les
	people getting sich and more people living at artight
	age, then there would be tess people absent from
	wooh. This would increase labour productivity,
	leading to an increase in outputs bymany firms
	and the ultimately an increase in ODP hence
	stimulating economic growth.

	Thirdy, Provision of health related men's goods was contained men's goods
	Thirdy, Provision of health related men't youds
	vaccination mens more social benefits for people
	a best graced of living and a move economic he call
	resources.
	On the other hand, an increase in the povovicion of
	healthure would result in opportunity cost that is the
_	heat best alterative forgone. This is because more
	government expenditure on healthcome mouns less
	money to be opent on other aspects of an economy
	. For example, the money could be spent on improving
	education hence, inpromy the shihamal education
	ot labor, stimulating towne labour, productivity.
13704-117	The money could be spent on building baric intrac-
	tructure such is roads or motornings. Which will not
	only provide employment opportunities but also reduce
	hegetre externations like pollution from cars and
	sufficience as well.
-	Alou, an increase in provision of healthcare my
-	also men swring the population were havily, Theret
	reducing disposable income. This reduces spending,
	healthy economis gundh.
	All in all, an incomerse in the provision otheralth come
	hould benefit the whole comony only if The money
	spent on health and does not affect other area of
	expensione.
200 - 200	

Examiner comment – grade A

- (a) A relevant description of the economic problem is provided. (2/2)
- **(b)** This is a good answer with strong written comments which explained well how a production possibility curve (PPC) shows how choices have to be made as how to allocate resources. Its only shortcoming is that the PPC is not drawn to the axes. (5/6)
- (c) A clear, well written answer which makes a good contrast between how resources are allocated in market and mixed economic systems. (4/4)
- (d) A well-structured answer which makes good use of relevant economic theory and concepts including opportunity cost and productivity in considering both the advantages and disadvantages of an increase in the provision of health care. (8/8)

		the provision would cost a lot more to
		be facilitated so cods would increase Plus
		many poor people wouldn't be able to
		afford the severy high costs, giving them
		an unfair disadvantage and increasing
		chances of getting diseases if not
		medically treated properly. It depends on
2	d	the type of a conamy. A developing economy
		would benefit from more health cove because
		they are more prone to diseases but levels of

Examiner comment – grade C

(a) The answer recognises that the problem is that wants are unlimited whilst resources are limited. (2/2)

occur higher in developing economi

- **(b)** The diagram is not strong. It could have been taken to be a straight line production possibility curve if it had been drawn to the axes. The labelling of A and B is rewarded as two products as the text makes clear that these two letters refer to two distinct products. The written comments bring out the meaning of opportunity cost. The answer also touches on changing resource allocation although it might be more explicit on how fewer resources would be available to produce Good B. (3/6)
- (c) The comments here are relevant but more depth to the answer would have been useful. For example, in connection with a market economy, the role of the price mechanism might have been brought out and, in connection with a mixed economy, how resources are allocated by the two sectors might have been explained. (2/4)
- (d) This answer recognises how an increase in the provision of health care may improve the health of people but at a cost. It is, however, a rather generalised answer which does not include enough relevant economic concepts for a higher mark. The last points mentioned in connection with a developing economy are not adequately explained. Generally the answer requires more width and depth. (3/8)

		economy houldn't benefit from that.

Examiner comment – grade E

- (a) A brief but relevant description. (2/2)
- (b) The diagram has the possible shape of a production possibility curve. The labelling is, however, that demand and supply diagram and no trade off is shown. The written comments are too vague. (1/6)
- www.PapaCambridge.com (c) The points might be clearer and more developed but the answer does recognise the difference in terms of the role of the government in the two types of economic systems. (2/4)
- (d) Unfortunately, the answer lacks economic content. It is a very generalised discussion which does not even link to the possible effects on living standards and life expectancy. (0/8)

Total mark awarded = 5 out of 20

Question 3

- www.PapaCambridge.com Despite more cars being sold, world demand for bicycles is increasing. It has been est the world price elasticity of demand for bicycles is -0.18 but this does vary between count. indirect taxes imposed on bicycles also differ between countries.
 - (a) Define 'demand'.

(b) Explain three likely causes of an increase in demand for bicycles.

- [6]
- (c) Analyse why the demand for a product may be more price elastic in one country than in another country.
- (d) Discuss whether a government should impose indirect taxes only on products with inelastic demand.

Mark scheme

(a) Define 'demand'.

[2]

2 marks for the willingness and ability to buy a product or 1 mark for either willingness or ability to buy.

(b) Explain three likely causes of increase in demand for bicycles.

[6]

1 mark each for three causes identified e.g.:

- rise/fall in income (may be regarded as a normal or an inferior good)
- rise in the price of other forms of transport
- a greater desire to be fit/tastes
- rise in population size
- a successful advertising campaign

1 mark each for three explanations e.g.:

- with higher incomes, people are more able to buy bicycles
- cycling is a substitute for bus travel
- cycling is used both for transport and for leisure
- a larger population will mean there are more people to buy bicycles
- a successful advertising campaign will persuade more people to buy bicycles.

Note: accept any valid reason which would shift the demand curve for bicycles to the right but do not accept a change in price or a change in supply of bicycles.

(c) Analyse why the demand for a product may be more price elastic in one in another country.

1 mark for bringing out the meaning of PED or elastic demand – defined or implied.

- differences in the closeness of substitutes [1] availability of close substitutes will demand elastic [1]
- www.papaCambridge.com differences in the proportion of income spent on the product [1] the higher the proportion, the more elastic demand will be [1] note: also accept average income may vary in the two countries with demand being more inelastic in the richer country
- differences in what are considered to be luxuries and what are considered to be necessities [1] if the product is considered to be a luxury, demand is likely to be elastic
- differences in the price of bicycles [1] demand will be more elastic, the higher the price

Note: a maximum of 3 marks for identification of reasons.

(d) Discuss whether a government should impose indirect taxes only on products with inelastic demand. [6]

Up to 4 marks for why it should:

- imposing taxes on products with inelastic demand will cause price to rise [1] demand will fall by a smaller percentage [1] and so is a good source of tax revenue [1] higher tax revenue can be spent on e.g. education and health care [1]
- a significant rise in price may be needed to reduce demand [1] of harmful products [1].

Up to 4 marks for why it should not:

- indirect taxes may be imposed on products to discourage their consumption [1] will be more successful if demand is price elastic [1] demand will fall by more than the rise in price [1] a government may want to discourage consumption of demerit goods (not necessary to use the term) [1] also may want to discourage consumption of imports [1] in practice it may be difficult to estimate PED (1).
- some products with inelastic demand are basic necessities (1) and so imposing indirect taxes on them will harm the poor (1) indirect taxes are often regressive (1).

Examiner comment – grade A

- (a) A succinct and clear definition bringing out both the willingness and ability to purchase a product. (2/2)
- (b) The answer starts by explaining how a reduction in income tax can increase the ability of consumers to buy bicycles. The effect of the relative price of different forms of transport is well explained. A relevant reason is given for a change in tastes and preferences and it is explored. (6/6)
- (c) The answer starts with an accurate definition of price elasticity of demand and then goes on to analyse three relevant reasons for differences in elasticity in different countries. In each case, the candidate correctly analyses how the influencing factors affect the degree of price elasticity of demand. (6/6)
- (d) The effect of the impact of imposing taxes is explained in terms of price and quantity. This is followed by a confused discussion in relation to demerit goods and firms' revenues and profits. At the end the answer becomes relevant again by examining the effect on government revenue. (4/6)

3	c·)	Price clastic would depend only out a style the demand of Consumers them solves toward
		the demand of Consumers them solves toward
		the products And that why is it very important
		for the business to do the PED bera before
		they sell their probuets to see whether they
		are price elastic or price helastic in Sume Country
		People would demand about
		increase bowards Cars that would make
13117		prices more elastic where as in some other
		Countries demand would mostly increase
		towards bikes which would make cours
		less price elastic (a number which is
		greater than I would be said clastic so business
		Should decrease price and a number which is
		less than I is price inelastic in which
		business should increase prices to increase profit
		as it said in the Case the price of the bic is
		melastic with is - 0-8 but in other countries
No.		It may be elastic
3	9-7	Indirect taxes are taxes imposed on product, or
		people will pay tax as they buy products
		Example would be VAT or exurise duties.
		imposing indirect taxes only on products

	with inelastic demand may increase the gradely revenue because on not only people would
	revenue because on not ordy people would
	pay with incomes and entriproves & would
	pay for them but also children, house wives and
	at p dd pensioners where they will all
	benefit from and the increase in public
	expenditure and people or business may not
	be that much effected as products are price
	inelastic, but there may also be drawbacks
_	it want a act like regressive taxation where
	paris people will pay higher and richer people
_	will pay low proportion of there incomes and
	I think that the government should not
	Only impose takes on products that are
	Inelastic I think that they should also
	impose them on harmful goody and services
_	Such as drug, alcohol, ciggirates etc to
_	reduce demand for them.

Examiner comment - grade C

- (a) An accurate definition is provided. (2/2)
- **(b)** The answer starts well by explaining how an increase in income may increase demand for bicycles. It then, unfortunately, mentions a price reduction. This would cause an extension in demand rather than an increase in demand. The last reason given is essentially a repetition of an increase in purchasing power. (2/6)
- (c) This answer writes around the question. There is uncertainty shown about what is required and, as a result, some vague statements are made. There is a hint of awareness that cars may be regarded as more essential in some countries. Towards the end, the candidate is seeking to answer a different question i.e. how should a business use knowledge about price elasticity of demand. (1/6)
- (d) The answer makes some relevant points on both sides. It recognises that indirect taxes raise government revenue and may discourage consumption of e.g. alcohol. It also explains the extent of the effect on people and firms and the regressive nature of indirect taxes. Some points might be clearer, in particular, the comment on who pays indirect taxes. (5/6)

Examiner comment – grade E

- (a) This is a partial definition as the answer does not pick up on the ability to buy a product. (1/2)
- (b) This answer would have benefited from focusing more on why demand for bicycles might increase rather than on why bicycles are demanded. More economics needed to be applied. (2/6)
- www.PapaCambridge.com (c) The influence of income on price elasticity of demand is identified but not explained. What the answer does is to explain how income influences demand rather than price elasticity of demand. (1/6)
- (d) This is a limited answer. It recognises that demand will fall but does not mention that demand will fall by a smaller percentage than the rise in price. Indeed, this answer almost implies that demand will fall by a greater percentage. At the end there is some recognition that particular firms may be adversely affected. (1/6)

Total mark awarded = 5 out of 20

Question 4

- www.PapaCambridge.com The number of people employed in the banking sector in Turkey is increasing. The sec of a number of commercial banks, some of which are growing in size, and the Central Banks Republic of Turkey.
 - (a) Describe two functions of a central bank.

- [4]
- (b) Explain two types of internal economy of scale that a growing bank can enjoy.
- (c) Analyse how the spending pattern of high paid workers is likely to differ from the spending pattern of low paid workers. [4]
- (d) Discuss whether workers employed in banking are likely to earn more than workers employed in agriculture.

Mark scheme

(a) Describe two functions of a central bank.

[4]

1 mark each for two functions identified e.g.:

- issuing bank notes
- banker to the government
- banker to commercial banks
- managing the national debt
- lender of last resort
- implementing monetary policy

1 mark each for two descriptions e.g.:

- influences the money supply
- operates an account for the government which enables it to receive revenue and make payments
- commercial banks' accounts at the central bank enable them to make and receive payments between each other and to withdraw money

- issues government securities and pays interest on those securities
- will lend to commercial banks that find themselves in difficulty
- changes interest rates to control the exchange rate
- may adjust exchange rate to influence e.g. the current account position.

(b) Explain two types of internal economy of scale that a growing bank can enjoy.

1 mark each for two types identified e.g.:

- managerial
- financial
- technical
- risk bearing.

1 mark each for explanations of the two types identified linked to banking e.g.

- a larger bank may be able to employ specialist workers such as accountants
- a larger bank may be able to sell its shares more easily and/or borrow more easily from other banks
- a larger bank may be able to use advanced technology and large scale capital equipment
- a larger bank may be able to offer a range of financial services so if one is unsuccessful, it will not have a significant impact on profits.

(c) Analyse how the spending pattern of high paid workers is likely to differ from the spending pattern of low paid workers. [4]

1 mark for high paid workers are likely to spend more in total.

1 mark for high paid workers are likely to spend a lower proportion of their income.

1 mark for high paid workers are likely to spend a higher proportion of their income on luxuries/spend more on luxuries.

1 mark for high paid workers are likely to spend a lower proportion of their income on necessities/less on necessities.

Note: accept an answer which is based on low paid workers e.g. low paid workers spend less in total.

(d) Discuss whether workers employed in banking are likely to earn more than workers employed in agriculture. [8]

Up to 6 marks for why they might earn more e.g.:

Up to 3 marks for; some bank workers are skilled workers [1] these are in low supply [1] high demand [1].

Up to 3 marks for bank workers may be difficult to replace [1] may be very productive [1] and so have inelastic demand [1].

Up to 2 marks for: bank workers may need high qualifications/better trained [1] and so have inelastic supply [1].

Atrade un Papa Cambridge Com

Up to 2 marks for bank workers may be in a professional organisation/trade unwill give them more bargaining power [1].

Up to 6 marks for why they might not earn more e.g.:

Up to 4 marks for; some workers in banking are low skilled [1] e.g. cleaners whilst a workers in agriculture are high skilled [1] so supply of some bank workers may be high than some agricultural workers [1] and demand may be lower [1].

Up to 3 marks for: some agricultural workers are very experienced [1] pay tends to rise over time [1] due to promotion [1].

Up to 2 marks for: agricultural workers in a rich country may earn more than workers in banking in a poor country [1] earnings vary between countries [1].

Up to 2 marks for agricultural workers in some countries may be more likely to be in a union/labour organisation (1) and so may have more bargaining power (1).

Note: the question is a general one and so candidates do not have to refer to Turkey but those answers which mention that workers in banking in Turkey may be paid more because the industry is expanding should be credited.

Maximum of 4 marks for a list-like approach.

Example candidate response – grade A

Workes employed actionar worth than are lover and hence they can act higher But m some financial services direloped and hence agricultural get paid more people some people will be good more working in agricultural industry get paid more than banking in de banking industry because agricultural workers may get more experienced than paid more industry is more developed temen tentiany sector. Also, if the specialised has expertise in worked in agriculture moderati be paid more than workers In banking industry

Examiner comment - grade A

- (a) The answer recognises two functions and describes the function of lender of last resort in end detail. (3/4)
- www.PapaCambridge.com (b) Two internal economies of scale are identified. There is a brief link to how managerial economies of scale may benefit a bank. There is not, however, a sufficient link between technical/technological economies of scale and a growing bank. (3/4)
- (c) A relatively brief answer but one which does bring out the differences in the spending patterns of the two groups in terms of the amount spent, the proportion spent and what the two groups buy. (4/4)
- (d) This is a well-structured and pertinent answer. It recognises that bank workers are likely to be more skilled, better trained, may have stronger bargaining power and may be in more limited supply. The answer then does not just reverse these points. It recognises that in some countries, demand for financial services may be relatively low, some agricultural workers may be very experienced and the country may have more 'expertise' in agricultural production. (7/8)

Examiner comment – grade C

- (a) The answer identifies three functions of a central bank rather than the two functions required. could have been more usefully spent explaining two functions. (2/4)
- www.PapaCambridge.com (b) Again the answer identifies but does not explain. Buying economies and financial economies of scale are mentioned but the answer does not explain how these could reduce a bank's average costs of production. The candidate did seem rather confused about the nature of financial economies. (2/4)
- (c) The answer starts well by mentioning that high paid workers will spend more than low paid workers. Later in the answer there is some awareness shown that low paid workers spend more on necessities. The central part of the answer could be clearer as it seems to imply that the poor will spend a smaller proportion of their income which conflicts with the diagram drawn. (2/4)
- (d) The answer recognises the influence of skills and qualifications. Mentioning that banking workers are more skilled and qualified than agricultural workers is, however, the same as stating that agricultural workers are less skilled and qualified than banking workers. There is some confusion between the demand and supply of bank workers although the answer is clear on the influence of a high supply in connection with agricultural workers. Overall the answer is somewhat narrowly focused. (3/8)

Examiner comment – grade E

- (a) The issuing of new notes is identified and influencing the exchange rate is suggested. Unforture neither of these functions are explained. (2/4)
- www.PapaCambridge.com (b) One type of economies of scale is identified i.e. technical. It is not explained how this would reduce the average costs of a growing bank. (1/4)
- (c) The answer is too vague. There is also a tendency to exaggerate for example, the idea that low paid workers 'try to save all their money'. The tendency to exaggerate is seen in a number of answers at this level. (0/4)
- (d) The points mentioned about skills and education are relevant. These could have been developed by examining the effects of differences in education and skills on the demand for and supply of labour in banking and agriculture. Overall the answer is limited in its coverage. (2/8)

Total mark awarded = 5 out of 20

Question 5

- www.PapaCambridge.com A Zambian copper mine is operated by a foreign multinational company. The company is profit maximisation. Its mine creates pollution in the area, which causes diseases and crops. Some economists have suggested that the economy would benefit from the mine operated by the Zambian Government.
 - (a) Define a 'multinational company'. [2]
 - (b) Explain one goal a multinational company may have other than profit maximisation. [3]
 - (c) Explain why pollution is an example of market failure. [5]
 - (d) Discuss whether a mine operated by the government would be more likely to benefit an economy than one operated by a foreign multinational company.

Mark scheme

(a) Define a 'multinational company'.

[2]

2 marks for a company that produces in more than one country.

1 mark for any one of the following:

- has its headquarters in another country
- operates in more than one country
- has branches in more than one country
- is usually a PLC (but may be a state run MNC).
- (b) Explain one goal a multinational company may have other than profit maximisation. [3]

1 mark for identifying a goal i.e.:

- growth/increased market share
- sales revenue maximisation
- profit satisficing
- survival
- improve the environment performance of the company.

Up to 2 marks for explaining the goal e.g.

- an MNC may try to increase its size because it will make it more difficult for other firms to buy it [1] and because the salaries and managers may be linked to size [1]
- an MNC may try to increase market share to reduce competition [1] and so gain a monopoly position [1]
- achieving a high sales revenue may enable a firm to take greater advantage of economies of scale [1] and so reduce average costs [1]
- an MNC may wish to keep shareholders happy (profit satisficing) [1] and to pursue a range of other objectives e.g. improving environmental conditions [1].

www.PapaCambridge.com

(c) Explain why pollution is an example of market failure.

Up to 2 marks for defining market failure – where the market forces of demand a fail to achieve efficiency.

1 mark for recognising that pollution is an external cost/harmful impact on third parties.

1 mark for mentioning that market forces do not take into account external costs.

1 mark social costs will exceed private costs.

1 mark for mentioning that market prices do not reflect social costs/are too low.

1 mark for output will be too high.

(d) Discuss whether a mine operated by the government would be more likely to benefit an economy than one operated by a foreign multinational company. [10]

Up to 7 marks for why it might:

Up to 4 marks for: more likely to take into account social costs and benefits [1] rather than base decisions on private costs and benefits [1] as it main objective may be to benefit society [1] rather than maximise profit [1].

Up to 4 marks for: may have more funds to invest [1] can use tax revenue [1] this may enable it to expand production [1] and so raise employment [1].

Up to 3 marks for: may provide better pay [1] and working conditions for workers [1] e.g. shorter working hours [1].

Up to 3 marks for; may charge lower prices to domestic firms [1] lower costs of production [1] making them more price competitive [1].

Up to 2 marks for: unlikely to take profits out of the country [1] may use some of the profits to spend on e.g. education and health care [1].

Up to 7 marks for explaining why it might not:

Up to 5 marks for: may lack competitive pressure to be efficient [1] managers of the mine may think the government will not permit the mine to go out of business [1] as it would cause unemployment [1] so costs may not be kept low [1] may be a lack of innovation [1].

Up to 3 marks for: may lack funds to invest [1] government may have low tax revenue [1] will not be able to sell shares [1].

Up to 3 marks for: may lack expertise [1] government intervention may mean that it takes time to make decisions [1] and decisions may be distorted by political factors [1].

Up to 2 marks for: may be less likely to bring in new technology than an MNC [1] technology may be more advanced in other countries [1].

Maximum of 5 marks for a list-like response.

Examiner comment – grade A

- (a) The answer recognises the key point that a multinational company produces in more than one country. (2/2)
- **(b)** A brief answer which explains profit satisficing ('satisfaction') linked to the need to keep shareholders happy. (2/3)
- (c) The answer recognises that pollution is an external cost. It then seeks to link pollution to the failure to achieve efficiency. There could be rather greater clarity and more development. The reference to 'the market failing to be productive enough not to let this happen' is too vague. There could have been an analysis of the market price and output relative to the socially efficient levels. (3/5)
- (d) This initially appears to be in note form and is somewhat disjointed at the start. The points are, however, developed as the answer progresses. There is width in terms of both the government and a multinational company operating the mine with some depth. (9/10)

Total mark awarded = 16 out of 20

- (a) The answer reveals some awareness of what a multinational company is but the reference to 'involved in many countries' is rather vague. (1/2)
- **(b)** The answer is moving towards the idea of increased market share but does not quite get there. The comment about 'being better than the local competitors', was too vague. (0/3)
- (c) This answer is based on general knowledge rather than economics. It identifies how pollution may harm an economy but does not mention that these are external costs. (0/5)
- (d) There is a reasonable start to the answer focusing on the goals of a government and a multinational company and how the effects on the environment may differ due to ownership. In the second part of the answer, however, the candidate does not establish why a multinational company is more likely to create employment and invest than a government. (4/10)

Total mark awarded = 5 out of 20

Ouestion 6

- www.PapaCambridge.com In 2012, Mexico's monetary policy was successful in keeping the country's inflation in stable. Fiscal policy measures, including a rise in government spending, contributed to a high economic growth rate of 3.5% and a reduction in the country's unemployment rate.
 - (a) What is meant by 'monetary policy'?
 - (b) Explain two reasons why governments aim for low and stable inflation. [4]
 - (c) Analyse how an increase in government spending may cause economic growth. [6]
 - (d) Discuss whether a reduction in a country's unemployment rate will always benefit an economy. [8]

Mark scheme

(a) What is meant by 'monetary policy'? [2]

2 marks for reference to decisions on any two from interest rates, money supply and the exchange rate.

1 mark for reference to decisions on any one of the above.

(b) Explain two reasons why governments aim for low and stable inflation. [4]

1 mark each for two reasons identified:

- to promote investment
- to promote international competitiveness
- to avoid lenders, workers with low bargaining power and other groups experiencing a fall in purchasing power
- to protect savers
- to prevent people losing confidence in using the currency as money
- to prevent inflation causing unemployment.

1 mark each for two reasons explained:

- low and stable inflation creates certainty/makes it easier to plan
- if inflation rate is below that of rival countries, it can increase exports/reduce imports
- if incomes rise by less than inflation, the amount that can be purchased will fall
- savers will lose if inflation rate is higher than interest rate
- may result in people resorting to barter/especially if there is hyperinflation
- inflation can result in a loss in international competitiveness/reduce spending on domestic products.

(c) Analyse how an increase in government spending may cause economic growth. [6]

An increase in government spending may result in:

- higher demand [1] which will encourage firms to expand their output [1]
- higher government spending on education (1) may raise labour productivity [1] and so increase productive potential [1]
- higher government spending on investment [1] will increase productive potential [1]
- government subsidies to firms [1] reduces costs of production [1] encourages firms to produce more [1].

Maximum of 2 marks for a list-like approach.

(d) Discuss whether a reduction in a country's unemployment rate will alw economy.

Up to 6 marks for why it should:

www.PapaCambridge.com Up to 3 marks for: a reduction in unemployment is likely to increase output [1] higher of should raise living standards [1] may reduce poverty [1].

Up to 3 marks for; may improve the current account position [1] if the rise in output is due to a rise in exports [1] and exports rise by more than imports [1].

Up to 3 marks for: lower unemployment may raise tax revenue [1] e.g. from income tax [1] higher tax revenue can enable a government to spend more on education and health care [1].

Up to 6 marks for why it might not:

Up to 5 marks for: lower unemployment may cause a shortage of workers [1] this shortage may push up wage rates [1] higher wages may increase costs of production [1] higher costs can cause cost-push inflation [1] more likely to occur if the economy is operating close to full employment [1].

Up to 4 marks for: lower unemployment may increase total (aggregate) demand [1] higher demand may push up prices [1] causing demand-pull inflation [1] more likely to occur if the economy is operating close to full employment [1].

Up to 3 marks for; lower unemployment may increase a current account deficit [1] higher incomes may increase demand for imports [1] higher demand may divert products from the export to the domestic market [1].

Up to 3 marks for: a reduction in the unemployment rate does not necessarily mean fewer people are unemployed [1] unemployment may have risen if the labour force has risen [1] by more than employment [1].

Up to 4 marks for a list-like approach.

Note: accept answers which discuss the possible effects of high unemployment will always harm an economy.

Example candidate response – grade A

	ed questi	didate response – grade A Monetary policy is a demand-side policy which gives the government chance to pursue their domestic aims. It's
		Monetary policy is a demand-side policy which give the the government chance to pursue their domestic aims. It's locate for eight out by the central bank, to set the Interest parte: For eight during an inflation, government would instruct the central bank to recipe increase the interest rate and cool down the Tutlation.
Qb_	(b)	Government alms for stable inflation because they want to control unemployment rate. As high rate of inflation can cause reduce in real value of autrency and reduce the willing hes for businesses to produce. With the aim of busing cost the businesses would lay off many workers which cause appears the businesses would lay off many workers which cause appears they want price stability for government as well. Therefore, they want price stability to control the simployment rate.

0 6	(b).	They aim for stable and low inflation because they stable balance in trade. If the country has high rate of inflation with fast-rising and high level of price, then the products of the name country will be less competitive since less foreigned are willing to buy. With lower export, if might create a deficit in our case balance of payment which is imbalanced to control inflation can balance their trade.
	(C) -	Indicase in government spending could result in later rise in total output of the economy as well as an increase in aggregate demand. The supply-side policy could include foreig. A provision of training scheme, subsidies to businesses and increases spending in building public introstructures. When government spends on Providing public training scheme helps the labour to get skilled and more able to adapt to the atthose capitals used in production lines It can lead to improvement in productivity as well as output, and helps reach economic growth.
		By giving grants and subsidies, businesses are able to reduce their production costs and they are more willing and encouraged to for e.g. Invest in new technologies and auto- Thated production methods which can also stimulate the total output and organs a rise in GPPI WHM real.
		Increase government spends money investing in building public facilities, it stimulates the employment rate and people are having stable incomes due to employment. The aggregate demand will rise as well as the total output needed in response. Therefore, earnomic growth is reached.

061	(d).	To some extent, reduction in or unemployment rate ding
		To some extent, reduction in or unemployment rate. Almonios benefit an economy; as it can rise the general living standard of the population. However, with lower rate of unemplosment, more people are able to have stable incomes. This
		[] 마이스 사람이의 보는 사람들은 경기 전에 보면 보다 바다 되었다면 하고 있다면 하는데 되었다면 보다 다양이 되었다면 함께 보고 있는데 보다 보다는데 되었다면 하는데 되었다면 하는데 되었다면 보다 되었다면
	-	helps them to purmase daily necessities and bisentials.
		It also enables them to for eig. afford health care and
		better education for their family. Therefore, reduce in unempto -yment can rise the general living standard of population.

In addition, reducing unemployment rate also increases the real GDP of this economy. With more people being employed, there will be more contributions to the total amount of goods and services; produced increase in output could lead to increasing rate of economic growth, with rising government of the revenuer as well.
However, it wouldn't benefit the economy in the long— —term: With lower unemployment rate, more people would have disposible incomes and there will be a rise in the aggregate demand. In long—term, this will lead to a demand—pull inflation which could reduce the real purchasing power of money and cause e conomic problems again, like inflation.
In addition, with more people contributing to the output, there might be arise in the export as well since the amount of the total output increased. Therefore, there knight appear surplus on the time balance of payment and disobey the government's aim of creating trade balance.

Examiner comment – grade A

- (a) This is a clear and interesting answer. In terms of answering the specific question it is, however somewhat narrow. It recognises that monetary policy is concerned with decisions on the rate of interest but does not bring out the other monetary policy measures. (1/2)
- www.PapaCambridge.com (b) The answer starts by identifying a relevant reason 'to control unemployment'. It then goes on to provide a lucid explanation of how high inflation could cause unemployment. The second reason given is to achieve a balance on the current account of the balance of payments. This, again, is well explained, linking high inflation to a loss of international competitiveness and a reduction in exports. (4/4)
- (c) The answer starts by recognising that an increase in government spending would increase total demand. This might have been developed further at this point. The answer, nevertheless, goes on to explore in sufficient detail how government spending could go on training and subsidies to firms. There are good links provided to productivity and costs of production. Overall this is a thoughtful and intelligent answer. (6/6)
- (d) The answer starts well, indicating that it is going to be a discussion. It mentions that living standards are likely to rise and, unlike some answers, provides a good analysis of why. The effects on economic growth and tax revenue are also covered. The answer then examines the reasons why a reduction in a country's unemployment rate will not always benefit an economy in just sufficient detail for full marks. (8/8)

	tion towards on as their are so many employee
	and workers.

Examiner comment - grade E

- (a) The candidate recognises that monetary policy involves the use of the rate of interest. (1/2)
- **(b)** This answer starts by including a confusion that was seen in a number of scripts. This is that inflation increases rather than reduces the real value of money. The last two sentences are, unfortunately, too vague. The 'certain group' is not identified and how inflation might affect 'the average income of a country' is not explained. (0/4)
- (c) This is a reasonable answer but more links to economic growth needed to be established. For example, how increased employment could increase output might have been analysed. (3/6)
- (d) This answer recognises that lower unemployment will increase incomes. This point is, however, not developed. The comments towards the end are too vague and the link between higher employment and poor communication is not established. (1/8)

Total mark awarded = 5 out of 20

Question 7

- www.PapaCambridge.com In March 2012, the Indian Government increased the tariff on imports of gold. It did this the country's growing deficit on the current account of its balance of payments.
 - (a) Describe how a tariff could reduce imports.
 - (b) Analyse three causes of a current account deficit.

(c) Discuss whether a government should always be concerned about a growing current account deficit.

Mark scheme

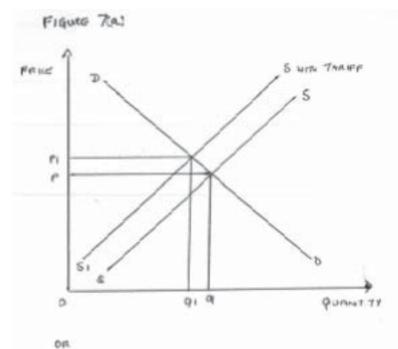

7 (a) Describe how a tariff could reduce imports.

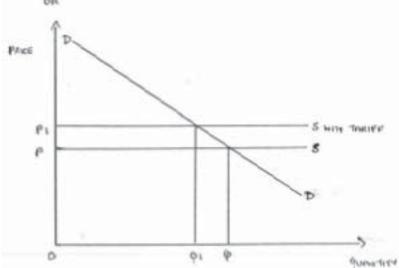

[4]

- 1 mark for recognising a tariff is a tax on imports.
- 1 mark for a tariff increases importing firms' costs of production.
- 1 mark for a tariff will reduce supply.
- 1 mark for a tariff will raise price.
- 1 mark for a tariff will reduce demand.
- 1 mark for relevant reference to PED of imports.

Note: Accept a diagrammatic approach showing supply decreasing, price rising and demand falling for 3 marks.

(b) Analyse three causes of a current account deficit.

1 mark for idea of the meaning of the current account/current account deficit.

1 mark each for three causes identified:

- high exchange rate
- inflation
- low productivity
- high costs of production
- low quality of domestically produced products
- low incomes abroad
- high incomes at home
- protectionism abroad
- lack of protectionism at home.

[6]

www.PapaCambridge.com

1 mark each for an analysis of three causes:

- · high exchange rate would mean high export prices and low import prices
- inflation makes domestic products less price competitive
- low productivity of labour will raise wage costs/high prices of domestic products
- high costs of production e.g. raw material cost/results in high prices of domestic production
- low quality reduces demand for exports and raises demand for imports
- low incomes abroad may result in low demand for exports
- · high incomes at home may lead to high demand for imports
- protectionism abroad e.g. tariffs make it difficult to export
- · absence of protectionism at home may result in e.g. dumping.
- (c) Discuss whether a government should always be concerned about a growing current account deficit. [10]

Up to 7 marks for why it should:

Up to 5 marks for: may indicate a poor economic performance [1] low demand for country's products [1] may be result of high inflation [1] poor quality products [1] low productivity [1].

Up to 3 marks for: will reduce total demand [1]and so may increase unemployment [1] and lower GDP [1].

Up to 3 marks for; may lead the country into debt [1] interest will have to be paid [1] this will involve an opportunity cost [1].

Up to 7 marks for why it should not:

Up to 5 marks for: may move later to a surplus [1] if imports are of raw materials [1] and capital goods [1] may be used to produce products to replace imports [1] and to be exported [1].

Up to 3 marks for: may be short term [1] especially if caused by falling incomes abroad [1] will be reduces when incomes rise [1].

Up to 2 marks for: may be a relatively small deficit [1] and/or may last for a short time [1].

Up to 2 marks for: there may be more serious macroeconomic problems [1] e.g. rising unemployment [1].

Maximum of 5 marks for a list-like response.

Example candidate response – grade A

ampl		didate response - grade A A tariff is bind of trade barrier that a impose taxation on imported appas to make it more expansive. Therefore
127	(a).	A tariff is shind of trade barrier that & impose taxation ?
		on imported goods to make it more expansive. Therefore,
		there is a less demand for imports and as well as reduce
		amount of it thrower, while protecting the name Industries
		there might be increasing demand for domestic products
(Min		teather than imports. Therefore, imports are reduced and aliscouraged.
		Tool -
07	(b).	Deficit means when there is more imports than exports in
解	(銀)	One cause could be the appreciation of the sum domestic
		currency when the currency appreciates, it grows more
		expensive for others to purchase their exports, therefore
		exports reduce . And it grows wheaper for the home country
		to purchase imports therefore import increases. Then there
		60 ic a deficit on the balance of payment.
		Another reason could be an best age decrease in the country's
•)		Interest rotte. This can result in an increase in aggregate
	- 0	demand stree it makes it easter for austomers to borrow.
		Therefore, the domand for imported goods could also increase
_	-1111	creating an Imbalance with overweighting imports.
		The last reason could be that when domestic goods are
	5 m = 4 12.5	uncompetitive: There might be lack of innovations and
		prop quality of the products existing in tors domestic
		businesses. Customers might purphase more of imported
		goods for better quality and less exports would be made
		as well strice there will be decreasing demand for
		uncompetitive goods.

be concern annotic

D7	(0).	On the one hand, the government should be concern almost a growing arrest account deficit since it cause had
		about a growing current account deficit since it cause
		unemployment. Deficit means less demand in exports and
		more in imports. With less exports, there will be less output
		needed in respond and businesses need to ray off workers to
		reduce costs as they re face tall in soles. Therefore, unomploy
		-ment could ourse and the total GPP could reduce as new.
		In addition, deficit also cause imported inflation which cause
		damage to the country's imports with higher demand in impor
7		ted goods. The rising demand will lead to demand - pull Timpor
_		ed inflation. The price level of the imported goods will be
		higher, as well. Therefore, a defiat could cause damage to
-	_	the Imports as well.
		However, the government doesn't need to be concerned in
		the long-run it they have touting exchange rate. The deficit of the trade means there is test demand of the country's
		products and more supply in excess. This can shift the value
		of the autrency to the left and the autrency depreciates.
		Depraciation can therefore bring about a correcting of the
	*	deficit since it's oneoper-for other countries to buy their exports
		and they would have less imports as it's more expensive.
_	<u> </u>	In conclusion, government doesn't need to be worrted since
		the ourrency as itself helps to correct the deficit and the
	_	problems caused by deficit as well.
		In condusion, I think that government stru needs to
		be concerned since there are countries which are still using
		tixed exchange rate and government intervention is needed
		largely. In addition, intervention our be effective in correcting
		deficit for e.g. In the case of Indian mentioned the use
		of trade barriers.

Examiner comment – grade A

- (a) The answer recognises the nature of a tariff and its effects on price and demand. It would have strengthened by describing the effect on costs and/or supply. (3/4)
- www.PapaCambridge.com (b) This is a strong answer. It starts by bringing out the meaning of a current account deficit. Although the candidate is effectively focusing on the causes of an increase in a current account deficit, the answer does clearly bring out the reasons why a country may have a deficit on the current account of the balance of payments. There is clear analysis of the effects of a rise in the exchange rate on exports and imports. It then provides an interesting analysis of the effect of a fall in the rate of interest and a lack of innovations. (6/6)
- (c) The answer tackles the question directly. The first paragraph provides good analytical links to the possible impacts on unemployment and output. There is reference to imported inflation although the point could have been established rather more. The answer then discusses why a government should not be concerned. There is a relevant discussion of how the deficit might be self-correcting with a recognition that this would not be the case if the country is operating a fixed exchange rate. (9/10)

Total mark awarded = 18 out of 20

Example candidate response – grade C

7	a) 1	B Setting a truff on imposts can make
		emports expensive and dis sourges to emport
		goods and serves from other countries and also
		eircreases demand for goods and services produces
		the the country.
	b)-	Imports are increasing
		Exports are decreasing persure of lower demand
		For goods and services, because of the other countries
		stick provides goods for cheapper
		Entrance during Inflation is motivasing
	- 8	to spend more on goods imported goods.

	c the government will be concerned about a grow and of deficit cense it is increasing imports and the
	delist course it is because about a grown as
	deficit seine it is increasing imports and the exports are decreasing, the government is then
	sering its own stocks to pay aff the debts
	or its revenue from taxe which could have
	used elsewhere to benefit the economy, Subsidies

	7000

Examiner comment – grade C

- (a) The answer recognises that a tariff may make imports more expensive and implies that demand for them may fall. A number of stages in the process are, however, omitted including the impact on supply. (2/4)
- **(b)** The answer starts by stating that imports are increasing and exports are falling. These movements would not necessarily mean that the country is experiencing a current account deficit. The answer then mentions that exports may be declining because the products are cheaper in other countries. This point might have been explored in more depth and two other causes needed to be identified and explained. (1/6)
- (c) There is a slip when it is mentioned that 'employment in the country may start to rise'. This can be taken as unemployment. There are a number of reasons mentioned as to why a government should be concerned about a growing current account deficit. These, again, might have been analysed in more depth. For instance, it might have been explained why the exchange rate may fall and the impact of a rise in unemployment. The answer is also one-sided. There is no discussion as to why a government should not be concerned about a growing current account deficit. Considering only one side in a discussion question limits the maximum marks available. (5/10)

Total mark awarded = 8 out of 20

Example candidate response – grade E

7.	a.	didate response – grade E Tarnic could reduce imports because it will charged more money from a hor person who imported the gold to India. It government charged a tarric is imported gold. It will be more expensive than before and demand as imported
		nor person who imported the gold to India. It government charged a tarris a
		imported gold. It will be more expensive than before and demand of imported
		gold will decrease. It imported products to being reduced, current account's
		depicit will reduce and lead into bothe bollance on payments.
Ψ.	ь.	Conses of a entirent account distint :
	-	-> High imported product amount in the country.
		Je country have to a much imported broducts, it will trake their current account
		desicit, because they not export equally with their import, and the piguie at
		, current account is not balance, tacome is higher outgoing monay is higher
		than incoming money.
		>> Low tax revenue.
		It government agesn't charged taxes or takes tarte as imported products.
		IT WILL Make big deficit at their account, because they can't get more
		tax revenue from imported products; and will be deficit at their current
		account.
		•>

7.	c.	Government should alway concerned about a growing current account desicit,
		because in current asse account deproit continue to growing and worst than
		before, infilation rate at the country will be therease and lead into soveral
		economic problems, and the most problem is economy crisis. Foreign exchange
		Ot country's currency will be decrease and most of people will exchange their
		money, because their currency is not valueable. After that price on the products will
_		mareage and more stateage that will make money unvalueable. So sovernment
		should alway concerned about a glowing current account depict and start
		to kalance their current account to audid some economic problems, specially
		economy erisis and high Intilation.

Examiner comment – grade E

- (a) The answer implies a tariff will increase price and states that it will reduce demand. It might have brought out why price may increase in terms of the effects that a tariff would have on costs of production and supply. (2/4)
- www.PapaCambridge.com (b) The answer starts by giving some idea of the meaning of a current account deficit. It then suggests that a deficit might arise if tariffs are not imposed. This point might have been more clearly expressed and it needed development. Other causes are not covered. (2/4)
- (c) The point about inflation is not established at the start. Imported inflation may occur but a growing deficit could also lower inflation by lowering aggregate demand and reducing the money supply. The answer then recognises that the growing deficit may reduce the exchange rate and explains why a government should be concerned about this. No other reasons for concern are covered. The answer is one-sided as it does not consider in what circumstances a government should not be concerned. (2/10)
