UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS International General Certificate of Secondary Education

www.papacambridge.com MARK SCHEME for the October/November 2009 question paper

for the guidance of teachers

0648 FOOD AND NUTRITION

0648/01

Paper 1 (Theory), maximum raw mark 100

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes must be read in conjunction with the question papers and the report on the examination.

CIE will not enter into discussions or correspondence in connection with these mark schemes.

CIE is publishing the mark schemes for the October/November 2009 question papers for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

Page 2	Mark Scheme: Teachers' version IGCSE – October/November 2009	Syllabus 0648	er
	Section A		Samp.
	n <u>ts in protein</u> – hydrogen – oxygen – nitrogen – phospho s	Syllabus 0648 Orus – sulphur hts = 1 mark	[3]
Growt Mainte Repair Energ	nance / ecretions / enzymes / antibodies / hormones		[3]
Conta	on of HBV protein ns all essential / indispensable amino acids ect proportion / in sufficient amounts	1 mark 1 mark	[2]
	i <u>les of HBV protein</u> - fish – milk – cheese – eggs – soya s	nts = 1 mark	[2]
	<u>on of LBV protein</u> It least one essential / indispensable amino acid		[1]
cereals gelatin		xample) – peas – beans -	- lentils –
(only c 4 poin	redit 'pulses' if no examples are given) s 2 poir	nts = 1 mark	[2]

(g) Digestion and absorption of protein

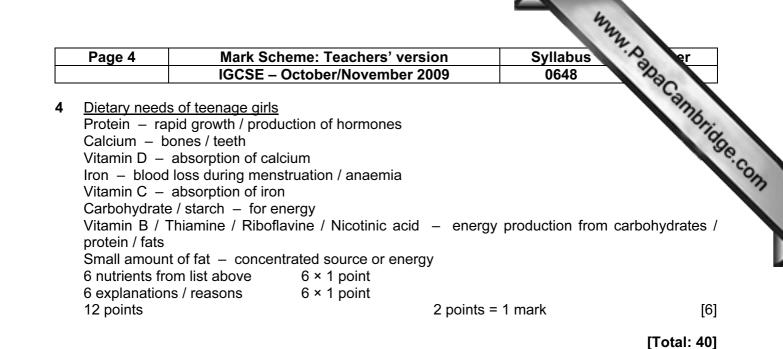

In the stomach, **hydrochloric** acid creates a suitable medium for the digestion of protein to begin. There are two enzymes in the stomach.

Pepsin converts protein to peptones / peptides / polypeptides and rennin clots milk.

In the duodenum, the enzyme **trypsin**, produced by the **pancreas** continues to convert protein to **peptones** / **peptides** / **polypeptides**. In the ileum, the enzyme **erepsin**, from **intestinal** juice, completes the breakdown of protein to **amino acids**.

Absorption takes place in the ileum. Finger-like projections, known as **villi**, provide a large surface area. The end products of protein digestion are absorbed into **blood capillaries**. They dissolve in **blood** and are carried around the body. 12 points 2 points = 1 mark [6]

						m	
	Pa	ge 3	Mar	k Scheme: Teach	ers' version	Syllabus	A er
		y		SE – October/Nov		0648	Sp.
	(h)	excreted	ited – in l as urine –	remainder used	removed – to forn for energy – or sto may lead to obesity 2 points =	n urea – carried red fat – under sk – CHD etc. 1 mark	
2	(a)	formation blood clo function	of nerves of muscles				[3]
	(b)	milk –		yoghurt – bones named example)	of canned fish (or n – bread 2 points =	. ,	hard water – [2]
	(c)	-	<u>cy disease</u> ′ Osteomala	cia / Osteoporosis			[1]
3	(a)	absorptio	n of bones a	n and/or phosphoru	as		[2]
	(b)	liver – f butter			ed example) – egg t part of question) 2 points =	-	< – cheese – [2]
	(c)	People v Those w skin People v smoky a People v of buildir 2 groups	who are hous who cover th who live in i tmosphere who live surr ngs etc.	eir body for religic ndustrial / polluted	n <u>t</u> rly – not outdoors s bus reasons – alth l areas – sunlight j uildings – sun cann 2 points =	ough outdoors, sun prevented from read ot reach them / alwa	cannot reach

Section B

- 5 (a) protein fat iron vitamin A / retinol vitamin D / cholecalciferol phosphorus sulphur vitamin B1 vitamin B2 vitamin B12 / cobalamin 6 × 1 point 2 points = 1 mark [3]
 - (b) <u>Reasons for toughness</u> long muscle fibres – thick muscle fibres – meat from an old animal – muscles have had most movement – e.g. neck / leg – muscles well-developed – animal stressed before slaughter – contains a large amount of collagen / connective tissue – and gristle / elastin – incorrect cooking method sued – e.g. dry method for a tough cut of meat – frozen meat not defrosted thoroughly before cooking etc. 4 points 2 points = 1 mark [2]
 - (c) <u>Methods of tenderising meat before cooking</u> mince / cut into small pieces – score / shorten muscle fibres – beat (with hammer / rolling pin) – hang – marinade / soak in wine / lemon juice / vinegar etc. – use enzymes / papain from papaya / bromalin from pineapple (Do not credit use of commercial tenderiser.) 4 points 2 points = 1 mark [2]
 - (d) How tough meat becomes tender during cooking moist method of cooking – e.g. stewing / braising etc. – moisture penetrates between muscle fibres – collagen – insoluble – converted to gelatine – soluble – muscle fibres fall apart 6 points
 2 points = 1 mark [3]

Page 5	Mark Scheme: Teachers' version	Syllabus	S.	e
	IGCSE – October/November 2009	0648	De	-

(e) Processing soya to resemble meat

Advantages

Cambridge.com soya is HBV protein - contains all indispensable amino acids - only vegetable sour HBV protein - useful for vegans / vegetarians - more healthy than meat - low in fat meat contains saturated fat - linked to CHD - cheaper than meat - no preparation cooks quickly - without shrinking - takes flavours from other food - easy to transport dehydrated - easy to store - light to carry - meat extender - or meat replacement / substitute - e.g. sausages / mince / chunks - can mix with meat to give a cheaper product fortified with iron - and vitamin from B group - no risk of animal diseases - e.g. BSE / bird flu etc.

Disadvantages

processed food – artificial additives may have been used – to preserve – flavour – colour - some people try to avoid additives - long-term effect not known - may not like texture - no cooking aroma - does not taste like meat etc.

10 points (to include at least 2 points from each area) 2 points = 1 mark [5]

6 (a) Types of convenience food

frozen	– peas – ice cream – fish fing	ers etc.	
canned	- peaches - salmon - baked b	eans etc.	
dried	- instant dessert - custard pow	/der – stock cubes etc.	
ready to eat	- biscuits - potato crisps - me	eat pies etc.	
3 types × 1 p	oint	3 points	
3 examples >	1 point	3 points	
6 points		2 points = 1 mark	[3]

(b) Advantages and disadvantages of convenience foods **Advantages**

saves time - saves fuel - saves effort - easy to prepare - some of the preparation / cooking already done - easy to store - can shop less often - useful for emergencies easy to carry - wide variety available - little waste - readily available in many stores require little skill - may have extra nutrients added - may include cooking instructions some products would be too complicated to prepare - less equipment needed - less washing up - can enjoy food from other countries - foods out of season - no need to buy each separate ingredient etc.

Disadvantages

can be expensive - need to pay for packaging - small portions - may need to buy extra or add other dishes to meal – increases cost – can be high in sugar – high in fat – high in salt - low in NSP - contain artificial additives - e.g. colourings - flavourings preservatives - long term effects not known - some people allergic to certain additives loss of cooking skills – nutrients lost may not be replaced – e.g. vitamin C – vitamins B and C may be destroyed by heat during processing etc.

10 points (at least 2 points from each area)	2 points = 1 mark	[5]

			-		

(d) Safe use of electrical equipment

choose a reliable brand – covered by safety checks – have equipment serviced regularly – store in a dry place – avoid twisting flex – may damage wires – dry hands – in case of electric shock – switch off at socket before removing plug – shock from pins as they are pulled out – switch off at socket before removing blades / beaters – switch off at appliance before removing blades / beaters – no trailing flexes – danger of tripping – read instructions for use / make sure of how to use – check that plugs are wired correctly – no bare wires exposed – plugs should not be broken / have screws missing – do not try to mend – needs a qualified electrician – do not overload sockets – danger of fire – damage to appliance – no fraying flexes – danger of fire – and electric shock – handle processor blade with care – extremely sharp – do not leave in washing up bowl – store safely – in protective cover – make sure fuse is correct size – or motor may be burnt out – do not leave electric deep-fat pan near edge of work-surface – child could pull at flex and overturn pan – no metal in mircrowave – sparking – damage to microwave oven etc.

8 points

2 points = 1 mark [4]

7 (a) <u>CREAMING METHOD</u>

cream – fat and sugar – with wooden spoon / electric mixer – until light and fluffy – traps air – beat eggs – add gradually – beat well between each addition – prevents curdling – sift flour – trap air – remove lumps – and impurities – fold into mixture – with metal spoon – a little at a time – to prevent air being knocked out – soft dropping consistency **OR**

ALL-IN-ONE METHOD

sift flour - trap air - add all other ingredients - beat - with wooden spoon / electric mixer - until smooth - about 2 minutes - to incorporate air

grease and line tin / grease and flour tin – to prevent sticking – preheat oven – so cooking begins immediately – gas mark $4/325^{\circ}C/160^{\circ}C - 40-45$ minutes – until golden brown / firm to the touch / springs back when pressed / shrunk from sides of tin / skewer comes out clean (max. 2) – cool on a wire cooling rack – to allow steam to escape (Do not credit points on decoration.)

10 points

2 points = 1 mark [5]

		-2	
Page 7	Mark Scheme: Teachers' version	Syllabus	er er
	IGCSE – October/November 2009	0648	De
		•	0

(b) Variations

cocoa – coffee – lemon / orange – coconut – cherries – chopped nuts / almonds etc. – currants / raisins / sultanas – vanilla essence – almond essent pandan leaves etc. 2 points = 1 mark

(c) Changes taking place when the cake is baking

fat melts – sugar melts – absorbed by starch – starch absorbs liquid – carbon dioxide produced – action of moist heat – softens – swells – on baking powder – gases expand – push up mixture – makes the cake rise – bursts – open texture – water turns to steam – gelatinises – sugar on outside caramelises – starch dextrinises – Maillard browning – reaction of starch with protein – shape sets – coagulation of protein – shrinks – evaporation of water – crisp / dry outer surface – browns etc. 8 points 2 points = 1 mark [4]

(d) <u>Transfer of heat by convection and conduction</u>

Convection

through gases – e.g. air in oven – air heated by gas or electricity – molecules become less dense – rise – colder molecules fall – they are then heated – create convection currents – until a constant temperature is reached – heat energy is transferred by the movement of the gas molecules – oven is heated – and heat is maintained – heat passes to solid cake tin – or oven shelf – which heats by conduction – etc.

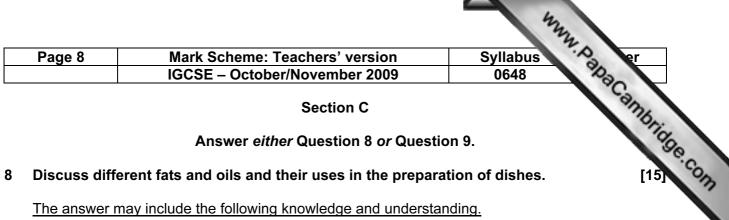

Conduction

through solids – e.g. oven shelf – cake tin – or liquids – e.g. cake mixture becomes liquid when heated – by contact between molecules – molecules vibrate rapidly – neighbouring molecules vibrate – generate heat – pass heat to adjoining molecules – heat passes to all parts of cake – beginning at outside – where mixture touches tin

10 points (at least 2 from each area)

2 points = 1 mark [5]

[Total: 45]

Section C

Answer either Question 8 or Question 9.

8 Discuss different fats and oils and their uses in the preparation of dishes.

The answer may include the following knowledge and understanding.

Types of fats and oils

fats are solid at room temperature - oils are liquid at room temperature - saturated fats hold maximum hydrogen - single bonds - e.g. butter / lard / suet - may give information in diagrams - found in animal products - e.g. milk / cream / bacon / meat etc. - cholesterol in saturated fat - deposited in arteries - narrows - blocks - associated with CHD - excess causes obesity - oils can be monounsaturated - one double bond - oleic acid - in olive oil can take up more hydrogen - at double bond - to make single bonds - polyunsaturated fats more than two double bonds - linoleic acid - hydrogenation - nickel catalyst - hardens oils changes uses - oils hydrogenated to make margarine - fat softer if process incomplete - fats and oils made up of different fatty acids and glycerol – different fatty acids produce fats and oils of differing 'hardness' - 'soft' margarine is easier to cream - 'hard' margarine easier to rub in at least 40 different fatty acids known - butyric / oleic / stearic etc. - all have different properties - taste - decomposition point etc. - fats and oils are usually a mixture of different tryglycerides - choose fat or oil according to use - oils usually from plants - e.g. corn / sunflower / soya etc. - some plants produce solid fat - e.g. cocoa butter - some animals produce oil - e.g. whale / fish etc. - fats and oils have different smoke points - high smoke point for frying – fats decompose into glycerol and fatty acid on heating – irreversible – butter decomposes at too low temperature for frying - corn oil at high temperature - fatty acids have different flavours etc.

Uses

spreading on bread – butter / margarine frying – corn oil / sunflower oil / dripping sauce-making - margarine / butter - colour - and flavour aeration – margarine traps air when creamed with sugar – rich cakes pastry-making - holds layers apart in flaky pastry - traps air when rubbed with flour shortcrust pastry shortening - crumbly texture - of shortbread - rock buns adding flavour - butter in cake making improve keeping quality – high proportion of fat in Christmas cake etc. sealing – melted butter / margarine on pate to prevent drying adds calories without adding bulk - frying - enriches - adds vits. ADEK dressing - adds moisture - flavour - glossiness - French dressing - forms and emulsion mayonnaise basting – adds moisture – and flavour – to fried / roast / grilled meat etc. vegans will not use animal fat - those with CHD choose polyunsaturated fats lubricates – prevents pasta sticking together glazes - boiled potatoes etc. butter icing for cake decorating - mixture of margarine and icing sugar prevents sticking on cake tins – brushed before baking adds colour - fried food becomes golden etc.

9 Discuss eggs and their uses in the preparation of dishes.

The answer may include the following knowledge and understanding.

Nutritive value

Cambridge.com protein – ovalbumin – mucin – HBV – growth – repair energy – hormones etc. fat - emulsion - energy - warmth etc. iron - formation of haemoglobin - red pigment - transports oxygen - prevention of anaemia etc. vitamin A – mucous membranes – skin – visual purple – night vision etc. vitamin D – absorption of calcium – bones / teeth riboflavin – from B group of vitamins – release of energy from carbohydrate lecithin – emulsifier water

Storage

Cool place - e.g. refrigerator - away from strong smells - e.g. cheese / fish - smell absorbed through porous shell - do not wash - remove protective cuticle - bacteria penetrate shell - round end up - keep air space in place - separate for freezing - water freezes and breaks shell – add salt or sugar – note on label – hens eggs usually used in cooking – duck eggs / quails' eggs etc. used - thick white becomes thinner during storage - spreads more when broken - moisture lost through shell - size of air space increases - test for freshness by placing in brine – sinks if fresh – heavier – hard-boiled egg may have black ring around yolk - iron sulphide - iron in yolk and sulphur in white etc.

Effect of heat

ovalbumin / egg white coagulates (sets) - at 60°C - protein in yolk at 70°C - yolk thickens becomes powdery - difficult to digest - white becomes rubbery - if cooked too quickly proteins shrink rapidly - syneresis - liquid squeezed out - irreversible

Uses of eqgs

trapping air – whole eggs with sugar – in Swiss roll etc.

- egg white traps 7 × volume ovalbumin stretches meringue etc.
- lightening whisked egg white in mousse etc.
- thickening custard / sauce / soup protein coagulates at 60°C
- emulsifying lecithin in egg yolk is emulsifying agent mayonnaise etc.

binding - rissoles / fish cakes etc. - coagulation of protein

- setting guiche / baked cake
- coating with breadcrumbs or flour forms a seal around food fish etc. prevents absorption of fat / breaking up / protects from hot fat
- glazing white / yolk / whole egg on pastries / bread to give shine and browns on heating – denaturation of protein

enriching – to sauces / soups / milk pudding – adds HBV protein

- garnishing hard-boiled egg in salads separated egg white and egg yolk on dressed crab etc.
- main dish boiled / poached / scrambled / omelette etc. easily digested guick to cook source of HBV protein
- clarifying whisked egg white in consommé / mint jelly etc.
