Fig. 1.1

She set up the apparatus shown in Fig. 1.1. The metre rule was positioned so that, with no load on the beam, the top of the beam was level with the 0 cm mark.

The student added a 100 g load to the end of the beam and recorded the displacement of the beam using the metre rule. She added further 100 g loads, recording the displacement of the beam, until the total load was 500 g. She recorded her results in a table, Fig. 1.2.

load/g	displacement/cm
0	0
100	
200	
300	10.0
400	15.5
500	22.0

(a) The measurements of the bend of the beam, for 100 g and 200 g are shown in Fig. 1.3.
 Record these measurements, from the top of the beam, in Fig. 1.2. [2]

	4	For Examiner's
(e)	Describe how the student could use this apparatus to measure the mass of a that weighed between 200 g and 500 g.	Use

www.papacambridge.com 2 A student investigated how the current passing through a light bulb was affected by c the applied voltage. Fig. 2.1 shows the circuit that he used.

Fig. 2.1

- He set the variable resistor to the highest value.
- He wrote down the readings of the milliammeter and voltmeter in Fig. 2.2.
- He decreased the resistance of the variable resistor and then read the milliammeter and • voltmeter again, repeating this several times.
- He plotted a graph of voltage against current, Fig. 2.4. •

voltage/volts	current/milliamps
0.5	35
1.1	80
2.0	170
2.5	280

Fig. 2.2

(a) Fig. 2.3 shows the voltmeter and milliammeter for the two missing sets of real Read the meters and complete Fig. 2.2.

Fig. 2.4

(c) (i) Explain how the brightness of the bulb changed as the resistance of the variable resistor was decreased.

..... .....[1] (ii) Explain why the current might suddenly drop to zero above a certain applied voltage. .....[1] (d) Did the light bulb obey Ohm's Law? Explain your answer. .....[1]

- 3 A student made a sample of copper(II) nitrate, a blue crystalline salt.
- www.papaCambridge.com He weighed out a sample of copper into a beaker. He placed the beaker in a fun cupboard and then added some concentrated nitric acid. A poisonous acidic gas was given off. When the reaction had finished, some copper remained in the beaker.
  - He separated the excess copper from the solution.
  - Then he obtained copper(II) nitrate crystals from the solution.
  - (a) Fig. 3.1 shows the balance windows for weighing the copper.

beaker and copper before the reaction

## Fig. 3.1

(i) Record the balance readings in the spaces below. mass of beaker only = ...... g (ii) Calculate the mass of copper in the beaker. mass of copper in the beaker = ...... g [3] (b) Carefully explain how the student can show that the gas given off during the reaction between copper and nitric acid is acidic. ..... .....[1]

www.papaCambridge.com (c) The student washed, dried and weighed the excess copper in the beaker. Fig. 3.2 shows the balance reading for the beaker and the excess copper left after reaction.

beaker and copper left over after the reaction

## Fig. 3.2

(i) Record the reading in the space below.

mass of beaker and excess copper = ...... g

(ii) Calculate the mass of copper that was used up in the reaction with the nitric acid.

mass of copper that reacted with the nitric acid = ...... g [1]

(d) Copper(II) nitrate forms blue crystals that decompose if they are heated. Carefully explain how the student could obtain copper(II) nitrate crystals from the solution.

..... .....[2]

www.papacambridge.com (e) The student collected and weighed the crystals in the same beaker that he used Fig. 3.3 shows the balance reading.

beaker and copper nitrate crystals

## Fig. 3.3

(i) Record the reading in the space below. (ii) Calculate the mass of copper (II) nitrate crystals. mass of copper(II) nitrate crystals = ..... g [2] The teacher said that the mass of copper dissolved by the acid would make 12.1 g of (f) hydrated copper(II) nitrate. Suggest one reason why the student did not get as much copper(II) nitrate crystals as this. ..... .....[1]

- A student investigated the relative densities of five gases, A, B, C, D and E. She u 4 identical balloons.
  - She filled one balloon with gas A. •
- www.PapaCambridge.com She then held the balloon at the point exactly half way between the floor and the ceiling, in a room that was exactly 4 metres in height.
  - She let the balloon go and found the time that it took to rise to the ceiling or to fall to the floor.
  - She repeated this with the other gases, filling each balloon with gas until the volume was the same each time.

Fig. 4.2 shows two of the times. The student also recorded whether the balloon fell to the floor or rose to the ceiling. The times for the other three balloons are shown on the stopclocks in Fig. 4.1.

Fig. 4.1

(a) Record the times in Fig. 4.2.

gas	time/s	rise or fall
Α	2	rise
В	9	rise
С		fall
D		rise
E		fall

Fig. 4.2

[3]

(b)	Whi	12 ich of the five gases had the greatest density? Explain your answer.	For Examiner's Use
(c)	Wh	y did some of the gases rise and some of them fall?	
(d)	 Whỵ	y was it important that the volume of each balloon was the same each time?	2]
(e)	 (i)	[1 Another student suggested that gas <b>A</b> could be hydrogen. What data from th experiment supports this?	  ] e
	(ii)	[1] What test can the student do to confirm that the gas was hydrogen and what is the result of this test?	  ] e
		test[2	2]

- Tests were carried out on two white crystalline solids, A and B. Fig. 5.1 sho 5 observations and the conclusions of some of the tests.
  - (a) Complete the table, Fig. 5.1.

	to[1]		

www.papaCambridge.com (b) When solid A is mixed with solid B and water is added, a gas is given off. Descri you would measure the volume of this gas. You can answer this question by draw labelled diagram in the space below.

6 A student read that an object floats in water when its density is less than that of water.

When the density of the object is just greater than that of water, it will sink. When the mass in g of a vessel placed in water is just greater than its volume in cm<sup>3</sup>, it will sink, since the density of water is equal to  $1 \text{ g/cm}^3$ .

The student decided to test this statement by carrying out an experiment using a plastic drinking cup.

(a) To find the volume of water that the cup would hold, he filled a measuring cylinder up to the 250 cm<sup>3</sup> mark. He poured water from the measuring cylinder into the cup until it was completely full. He did not let any water spill over. Suggest a way of putting the last few drops of water into the cup so that it is full but not spilling over.

.....[1]

www.papacambridge.com (b) Fig. 6.1 shows the scale of the measuring cylinder after the cup was filled.

(i) Record the volume of water left in the 250 cm<sup>3</sup> measuring cylinder in the space below. volume of water left in the measuring cylinder ...... cm<sup>3</sup> [1] (ii) Calculate the volume of water placed in the cup. volume of water in the cup .....  $\ensuremath{\mathsf{cm}}^3$ [1]

www.papacambridge.com The student emptied all the water out of the cup, then he placed 50 cm<sup>3</sup> of water He placed the cup into a beaker about half-full of water. See Fig. 6.2.

He measured the distance h mm shown in Fig. 6.2, and recorded it in the table, Fig. 6.3.

volume of water in the cup/cm <sup>3</sup>	height <b>h</b> / mm
50	36
70	
90	22
110	
130	6

Fig. 6.3

The student put another  $20 \text{ cm}^3$  of water into the cup, and measured **h** again. He repeated this, adding  $20 \text{ cm}^3$  of water each time until a total of  $130 \text{ cm}^3$  was reached.
