## www.papacambridge.com MARK SCHEME for the October/November 2007 question paper

## **5070 CHEMISTRY**

5070/02

Paper 2 (Theory), maximum raw mark 75

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began.

All Examiners are instructed that alternative correct answers and unexpected approaches in candidates' scripts must be given marks that fairly reflect the relevant knowledge and skills demonstrated.

Mark schemes must be read in conjunction with the question papers and the report on the examination.

CIE will not enter into discussions or correspondence in connection with these mark schemes.

CIE is publishing the mark schemes for the October/November 2007 question papers for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

(c)	(i)	oxida NOT ALL(	ation because loss of electrons <sup>-</sup> : redox/OH <sup>−</sup> loses electrons OW: <u>hydrogen/H</u> ₂ increases oxidation number/gains oxygen	[1]
	(ii)	O <sub>2</sub> +	$2H_2O + 4e^- \rightarrow 4OH^-$	[1]
(d)	(i)	2H <sub>2</sub> ·	$+ O_2 \rightarrow 2H_2O$	[1]
	(ii)	hydr	ochloric acid/sulphuric acid (or formulae)	[1]
(e)	(i)	mag argu Mg I surfa	nesium is more reactive/higher in the reactivity series/better reduct ment; loses OR gives off electrons more readily than copper/electron den ace of Mg/electrons flow from more reactive to less reactive metal	tant or reverse sity greater on [2]
	(ii)	mag copp ALL(	nesium would react with it/the metals would react with it/ per would react with it/a precipitate of silver would be formed OW: silver nitrate is very expensive/lower conductivity	[1]

I uge I	Mark Scheme	Syllabus	er er
	GCE O LEVEL – October/November 2007	5070	Day
10(a) any 2 o • silicate ALLOW • silicate calcium • all the some a • silicat	f: e has regular arrangement of atoms and soda-lime gla /: e.g. soda lime glass has a less regular arrangement e has no ions/named ion(s)/all atoms (covalently) bo /sodium ions; [ALLOW: has oxygen ions] oxygen atoms are (covalently) bonded to two silicon a re only bonded by one (covalent) bond; e has larger spaces/an open structure and soda-lin	ass has irregular arra of atoms ORA onded and soda lim atoms in silicate but me glass has a mo	e glass h in soda lime ore compact
(b) Ca <sup>2+</sup> /Na ALLOW NOT: io	e/collapsed structure a <sup>+</sup> <u>ions</u> can move /: <u>ions</u> can move/ <u>ions</u> are free to move ons are delocalised/ions are free		[2]
(c) CaCO <sub>3</sub> (	$(s) \rightarrow CaO(s) + CO_2(g)$		[1]
<b>(d) (i)</b> hyd	droxide/OH <sup>−</sup>		[1]
<b>(ii)</b> Pb <sup>2</sup> lead unt	$^{2+}$ + 2OH <sup>-</sup> $\rightarrow$ Pb(OH) <sub>2</sub> (complete balanced equation d hydroxide formed/lead hydroxide is white/hydroxi balanced equation = 1 mark	= 2 marks) de ions react with	[2] the lead or

(gas) measured at various time intervals/take readings of clock every so often; NOT: use a stop clock without any qualification of how it is used OR

use (sensitive) balance/top pan balance; record mass; at various time intervals; [3]
