**PHYSICS**

**0625/62**

Paper 6 Alternative to Practical

**May/June 2017**

**1 hour**

Candidates answer on the Question Paper.  
No Additional Materials are required.

**READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.  
Write in dark blue or black pen.  
You may use an HB pencil for any diagrams or graphs.  
Do not use staples, paper clips, glue or correction fluid.  
**DO NOT WRITE IN ANY BARCODES.**

Answer **all** questions.  
Electronic calculators may be used.  
You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.  
The number of marks is given in brackets [ ] at the end of each question or part question.

The syllabus is approved for use in England, Wales and Northern Ireland as a Cambridge International Level 1/Level 2 Certificate.

This document consists of 12 printed pages.

1 The class is investigating the resistances of two resistance wires.

The circuit used is shown in Fig. 1.1.

Fig. 1.1

(a) A student places a sliding contact **S** on the resistance wire **AB** at a distance  $l = 0.200\text{ m}$  from point **A**. She measures the current  $I$  in the circuit and the potential difference  $V$  across the length  $l = 0.200\text{ m}$  of resistance wire.

Figs. 1.2 and 1.3 show the voltmeter and ammeter readings.

(i) Write down the readings shown on the meters in Figs. 1.2 and 1.3.

Fig. 1.2

Fig. 1.3

$V = \dots\dots\dots 0.8\text{ V} \dots\dots\dots$

$I = \dots\dots\dots 0.65\text{ A} \dots\dots\dots$

[2]

(ii) Calculate the resistance  $R$  of the length  $l = 0.200\text{ m}$  of resistance wire, using the equation

$$R = \frac{V}{I}$$

$$R = 0.8 \div 0.65 = 1.23\ \Omega$$

$R = \dots\dots\dots 1.23\ \Omega \dots\dots\dots$  [1]

- (b) The student repeats the procedure using the distance  $l = 0.400$  m. Her result is shown.

$$R = \dots\dots\dots 2.54 \Omega$$

- (i) Calculate the difference between the two values for  $R$ .

$$2.54 - 1.23 = 1.31 \quad \text{difference} = \dots\dots\dots 1.31 \Omega \dots\dots [1]$$

- (ii) Suggest a relationship between the length  $l$  and the resistance  $R$  of the wire that matches the results, within the limits of experimental accuracy.

*length is directly proportional to resistance*  
 ..... [1]

- (c) Using the same method as in (a), the student determines the resistance  $R_1$  of the resistance wire **AB** of total length  $l = 0.500$  m.

$$R_1 = \dots\dots\dots 3.08 \Omega$$

She then uses a short lead to connect points **B** and **D**. She uses the same method again to determine the combined resistance  $R_2$  of the resistance wires **AB** and **CD** connected together.

$$R_2 = \dots\dots\dots 1.50 \Omega$$

Use the student's results to compare the resistance  $R_1$  of wire **AB** with the resistance  $R_2$  of wires **AB** and **CD** connected together.

Tick the box next to the description that most closely matches the results.

$R_1 = R_2$

$R_1 = 2R_2$

$2R_1 = R_2$

There is no simple relationship between  $R_1$  and  $R_2$ .

[1]

- (d) Suggest **two** reasons why different students, all carrying out this experiment carefully, with the same apparatus, may **not** obtain identical results.

1. *Cell may run down / power of cell may be less*

2. *Difficult to measure length of wire to nearest mm*

3. *Different heating effects on wires* [2]

[Total: 8]

- 2 The class is investigating the refraction of light passing through a transparent block. A student is using optics pins to trace the paths of rays of light.

Fig. 2.1 shows the student's ray-trace sheet.

Fig. 2.1

- (a) • On Fig. 2.1, draw and label a normal  $NL$  at the centre of side  $AB$ . Label the point  $E$  where the normal crosses  $AB$ . Label the point  $M$  where the normal crosses  $CD$ . [1]
- Draw a line  $FE$ , to the left of the normal and at an angle of incidence  $i = 40^\circ$  to the normal.
  - Label the positions of two pins  $P_1$  and  $P_2$  on  $FE$  placed a suitable distance apart for accurate ray tracing. [2]

- (b) The student observes the images of  $P_1$  and  $P_2$  through side **CD** of the block so that the images of  $P_1$  and  $P_2$  appear one behind the other.

He places two pins  $P_3$  and  $P_4$  between his eye and the block so that  $P_3$  and  $P_4$ , and the images of  $P_1$  and  $P_2$  seen through the block, appear one behind the other.

The positions of  $P_3$  and  $P_4$  are marked on Fig. 2.1.

Draw a line joining the positions of  $P_3$  and  $P_4$ . Continue the line until it meets the normal **NL**. Label the point **K** where this line crosses **CD**. [1]

- (c) • Measure and record the angle  $\alpha$  between the line joining the positions of  $P_3$  and  $P_4$  and the normal line.

$$\alpha = \dots\dots\dots 40 \dots\dots\dots$$

- Measure and record the length  $x$  between points **M** and **K**.

$$x = \dots\dots\dots 17 \dots\dots\dots$$
 [2]

- (d) The student repeats the procedure but with the line **FE** to the right of the normal.

He measures the angle  $\beta$  between the line joining the new positions of  $P_3$  and  $P_4$  and the normal.

$$\beta = \dots\dots\dots 41^\circ \dots\dots\dots$$

He measures the length  $y$  between **M** and the new position of **K**.

$$y = \dots\dots\dots 21 \text{ mm} \dots\dots\dots$$

A student suggests that the results for  $\alpha$  and  $x$  should be the same as the results for  $\beta$  and  $y$ .

State whether the results support this suggestion. Justify your answer by reference to the results.

statement **No** .....

justification *The difference in the values of  $\alpha$  and  $x$  are beyond the limits of experimental accuracy* [2]

- (e) Suggest **one** precaution that you would take with this experiment to obtain reliable results.

1. keep pin separation distance large
  2. ensure that the pins are upright (vertical)
  3. use thin pencil lines
- [1]

[Total: 9]

- 3 The class is investigating images formed on a screen using a lens.

Fig. 3.1 shows the apparatus.

Fig. 3.1

- (a) The lens has a focal length of 15.0 cm.

Suggest a suitable distance  $D$  between the illuminated object and the screen in order to form a clearly focused image on the screen.

Accepted range (50-200 cm)  $D = \dots\dots\dots 100 \text{ cm} \dots\dots\dots [1]$

- (b) The student places the lens as shown in the diagram a distance  $u$  from the object. She then moves the screen until she obtains a clearly focused image on the screen.

It is difficult to decide on the exact position of the screen that gives the best image.

Explain how you would find the best position for the screen as reliably as possible.

Move the screen slowly and carefully back and forth till the best position is found.  $[1]$

- (c) Another student uses a different lens and obtains these readings:

$$u = \dots\dots\dots 15.0 \text{ cm} \dots\dots\dots$$

$$v = \dots\dots\dots 29.7 \text{ cm} \dots\dots\dots$$

Calculate the focal length  $f$  of the lens using the equation  $f = \frac{uv}{(u+v)}$ .

Include the unit and give your answer to a suitable number of significant figures.

$$f = \frac{15 \times 29.7}{15 + 29.7} = 9.966$$

$$f = \dots\dots\dots 9.966 \dots\dots\dots [2]$$

- (d) Suggest **one** difference that you would expect to see in this experiment between the appearance of the object and the image.

Upside down / Magnified / fainter / coloured ..... [1]

- (e) Which of the following procedures, **A–F**, are sensible for this experiment?  
Circle one or more of the letters.

- A** Carry out the experiment in a darkened room.
- B** Close one eye when taking readings.
- C** Draw thin lines.
- D** Fix the rule in position on the bench.
- E** Make sure the pins are at least 5 cm apart.
- F** Repeat the experiment using different values of  $u$  and determine an average value for  $f$ . [3]

[Total: 8]

4 The class is investigating the principle of moments.

Fig. 4.1 shows the apparatus used.

Fig. 4.1

(a) A student places a load P on the metre rule at the 5.0 cm mark. He places the metre rule on the pivot at the 45.0 cm mark. He places a load Q on the rule and adjusts its position so that the metre rule is as near as possible to being balanced.

- He measures the distance  $a$  between the centre of load P and the pivot.
- He measures the distance  $b$  from the centre of load Q to the pivot.
- He repeats the procedure placing the load P at the 10.0 cm mark, the 15.0 cm mark, the 20.0 cm mark and at the 25.0 cm mark. He keeps the pivot at the 45.0 cm mark each time. The readings are recorded in Table 4.1.

Table 4.1

$a/cm$	$b/cm$
40.0	42.5
35.0	36.4
30.0	30.1
25.0	23.9
20.0	17.5

- (i) Plot a graph of  $b/cm$  ( $y$ -axis) against  $a/cm$  ( $x$ -axis). Start both axes at the origin  $(0,0)$ .

- (ii) Draw the line of best fit.

- (b) A student suggests that  $a$  is directly proportional to  $b$ .

State whether the readings support this suggestion. Justify your answer by reference to the graph line.

No. The line does not pass through the origin

.....

..... [1]

(c) The student uses a balance to measure the mass  $m$  of the metre rule.

$$m = \dots\dots\dots 120\text{g} \dots\dots\dots$$

- Calculate the value of  $mX$ , where  $X = 0.05\text{Ncm/g}$ .

$$120 \times 0.05 = 6\text{N}$$

$$mX = \dots\dots\dots 6 \dots\dots\dots \text{Ncm}$$

- Use the value of  $a$  in the first row of Table 4.1 to calculate  $Pa$ , where  $P = 1.00\text{N}$ .  $P$  is the weight of load  $P$ . Include the unit.

$$1.00 \times 40 = 40\text{N}$$

$$Pa = \dots\dots\dots 40 \dots\dots\dots$$

- Use the value of  $b$  in the first row of Table 4.1 to calculate  $Qb$ , where  $Q = 0.80\text{N}$ .  $Q$  is the weight of load  $Q$ .

$$0.80 \times 42.5 \\ = 34$$

$$Qb = \dots\dots\dots 34 \dots\dots\dots [2]$$

- (d) A student states that  $Pa$  should be equal to  $Qb$ .

Look carefully at Fig. 4.1 and the information in (c) and suggest what the student has not realised.

He has not taken into account the weight of rule.  
and hasn't thus realised that  $Qb + mX = Pa$ ..... [1]

[Total: 8]

- 5 A student is investigating the effect of draughts (moving air) on the rate of cooling of hot water.

The following apparatus is available to the student:

an electric fan with four speed settings

a supply of hot water

thermometer

250 cm<sup>3</sup> beaker

250 cm<sup>3</sup> measuring cylinder

stopwatch

clamp, boss and stand.

Plan an experiment to investigate the effect of draughts on the rate of cooling of hot water.

You should:

- explain briefly how you would carry out the investigation
- state the key variables that you would control
- draw a table, or tables, with column headings, to show how you would display your readings (you are **not** required to enter any readings in the table)
- explain how you would use your readings to reach a conclusion.

You may draw a diagram if it helps your explanation.

: After a fixed time interval say

60s

Fan speed	Initial temp of hot water / °C	Final temp of hot water / °C
1		
2		
3		
4		

Method:- Measure the initial temp of the hot water. Then for one particular fan speed,

measure the temperature of water at a fixed interval of time. For the same time interval and just changing the wind speed, measure the new temperature. Repeat for 5 different wind speeds.

Control variables: Initial temperature of hot water, room temperature, volume of hot water, distance of beaker from fan, time of cooling, Same beaker size and same material of beaker.

Table: Draw table as shown overleaf.

Conclusion: Compare readings to find which fan speed produces greatest cooling in the same time interval. [7]
